Agenda

- Who We Are & Background
- CVCS vs. DVCS
- Migration Strategies
- Bridging & Flow
- Mapping ClearCase & Mercurial
- Demo
- Technical Implementation

History

- Became interested in DVCS in 2008 and have since developed several Open Source extensions and solutions
 - Matrix reloaded (Jenkins plugin)
 - ClearCase UCM (Jenkins plugin)
 - javahg (java api for mercurial)
 - onsub (run commands on *all* sub-repositories)
 - and about 20 others
- Help customers get set for the future (workflow, architecture, migration, support, etc.)

The Future is Distributed

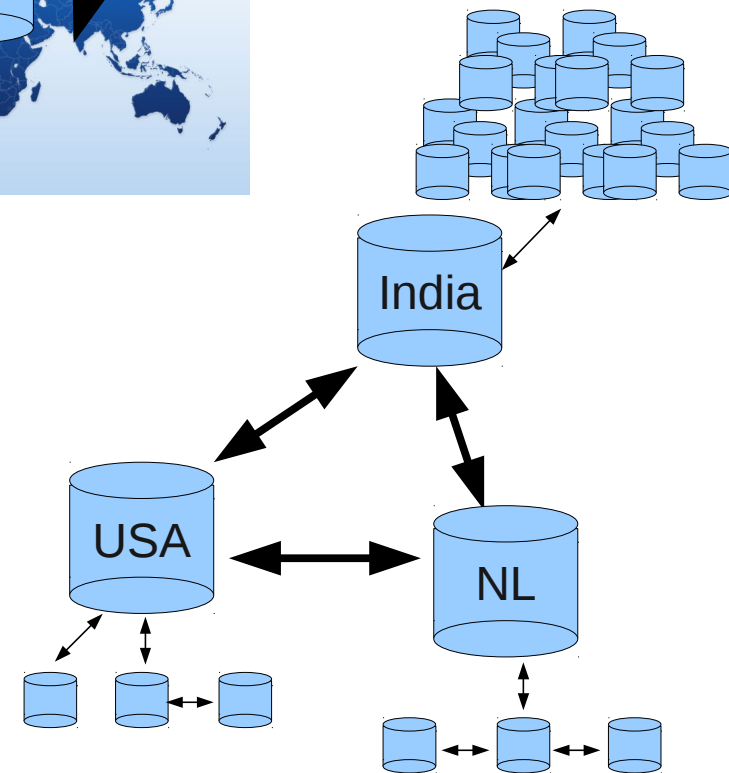

- CVCS (Perforce, SVN, CVS, ClearCase, etc.)

- Network **latency**
- **Single point of failure**
- **Constrained** workflow

- DVCS (Mercurial, Git, Bazaar, etc.)

- **Flexible** (workflow)
- **Distributed, off-line** operations (rich set of fast local operations)
- New tool to **learn**
- **Space** consumption

It Gets Even Better ...

- Derived effects
 - Fine grained commits
 - Searchable history
 - Branching and merging becomes natural task
(By the very nature of distributed work it has to!
“if something hurts, do it more often”)
 - Better workflows emerge
(e.g. feature branches; version maintenance; code reviews)

Management Convinced!?

CVCS

DVCS

Traditional Migration Strategies

- **Big Bang**

- Thorough analysis required
- Some standstill for everybody
- Bottleneck resources
(consultants, training, support, etc.)

High risk
& Expensive

- **Iterative / in stages** (e.g. by project)

- Interfacing between projects (sharing code)

Might not even
be an option

Too Expensive, Too Scary :-)

SVN
ClearCase
CVS

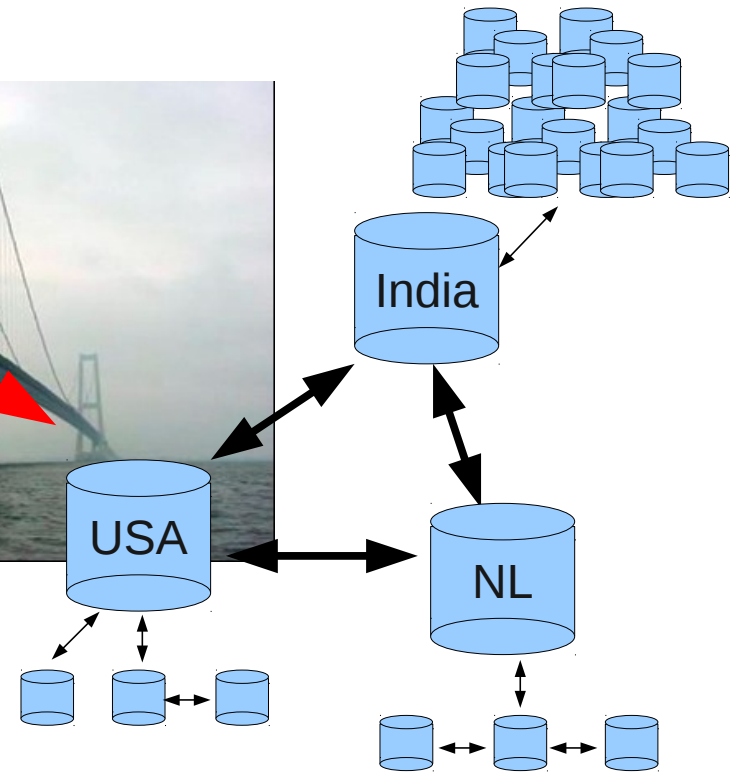

MKS
Perforce

Git
Bazaar
Mercurial

Bridging

“Changes in one tool are automatically reflected in the other and vice versa”

Bridging

- **Get the best of two worlds**
(different tools for different tasks - happy developers, happy process people, happy managers)
- **Protect your investment**
- **Defer commitment – Lean**
(Schedule irreversible decisions at the last responsible moment)
- **Possible migration path**
(allows for iterative migration)

Bridging Version Control Systems

- Modern version control systems
 - Bases on the same conception
 - Almost trivial to bridge
 - Many bridges
- ClearCase UCM
 - Bases on different conception
 - Not trivial
 - No bridges
- Make ClearCase UCM behave

ClearCase and Mercurial

- Version control systems
 - ClearCase UCM
 - Mercurial
- Differences
 - ClearCase versions each element
 - Mercurial versions the repository state
- The need for a stable reference
 - Mercurial has commits
 - ClearCase has baselines

Demonstration

- Jenkins as scheduler
 - Using two Jenkins plugins
 - Mercurial plugin
 - ClearCase UCM plugin
 - Two different jobs
 - ClearCase as source, Mercurial as target
 - Mercurial as source, ClearCase as target

Jenkins - More than a build server

- Continuous integration server
- Open source, vivid community
- Many plugins, and more to come
- Implemented in Java

Plugins, ClearCase UCM Plugin

- Developed by Praqma
- Three types of polling
 - Self, child and sibling
- Support for advanced work flows
- Baseline by baseline or latest
- Post build steps

Plugins, Mercurial Plugin

- Get latest
- Does not support advanced work flows
