Step 1

Incoming request directed to **Controller** via the **Route Handler**

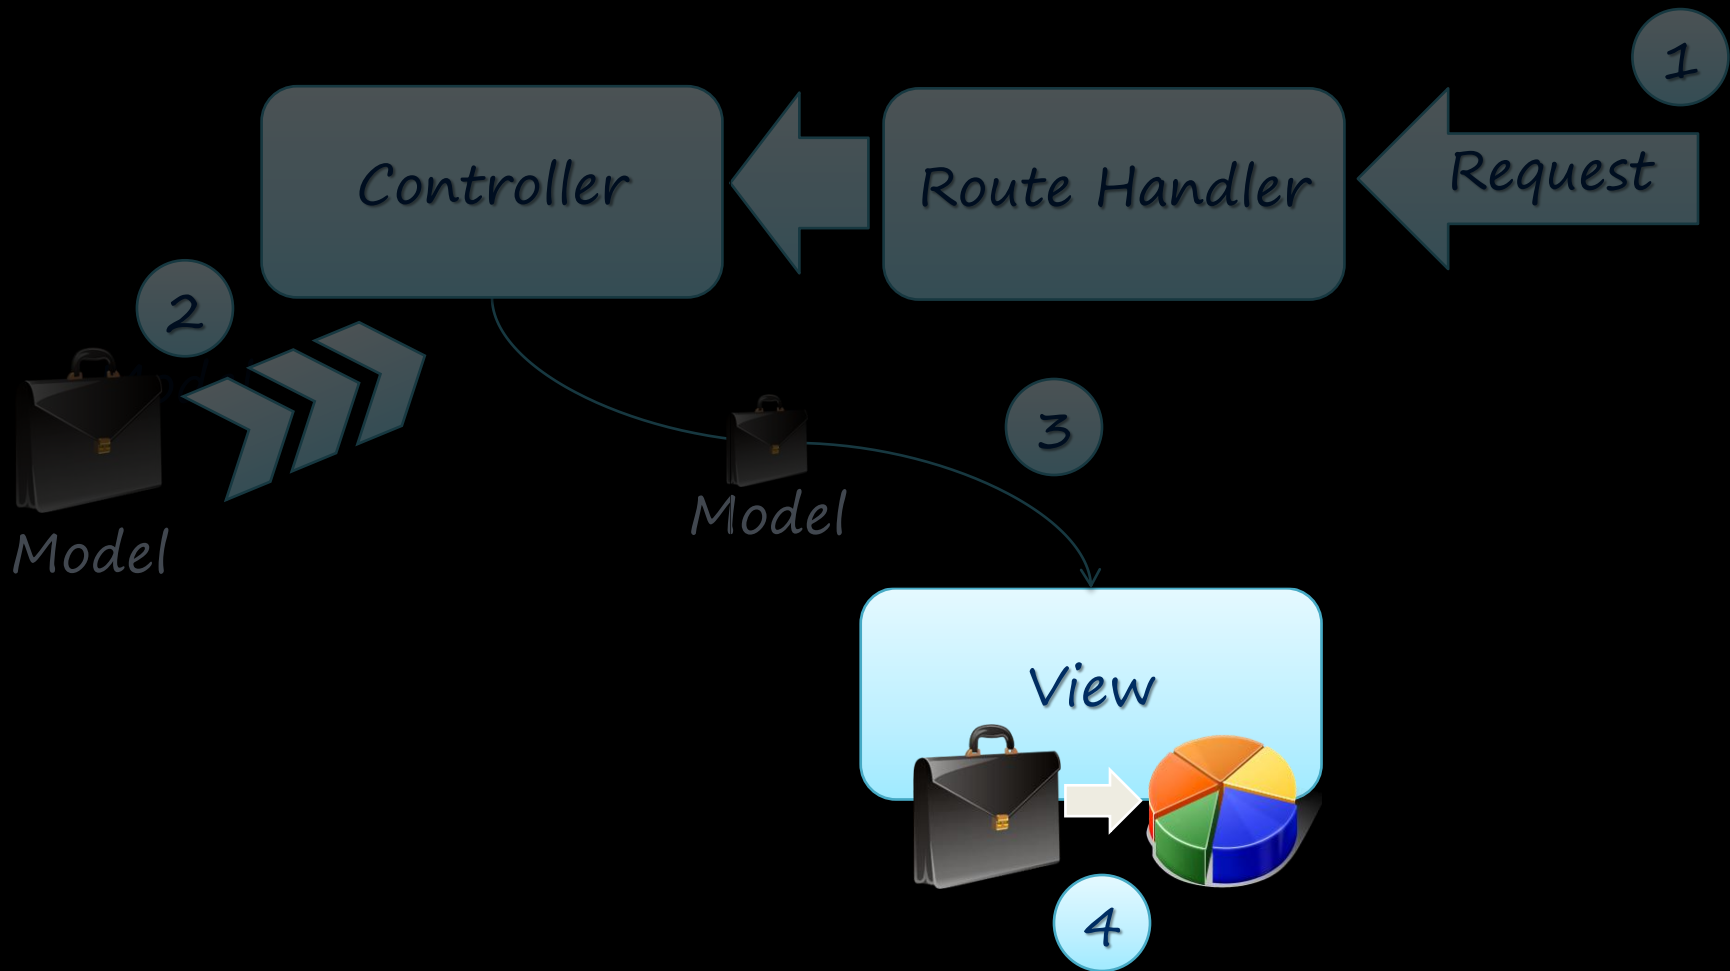

Step 2

Controller processes request and gets/forms a data **Model**

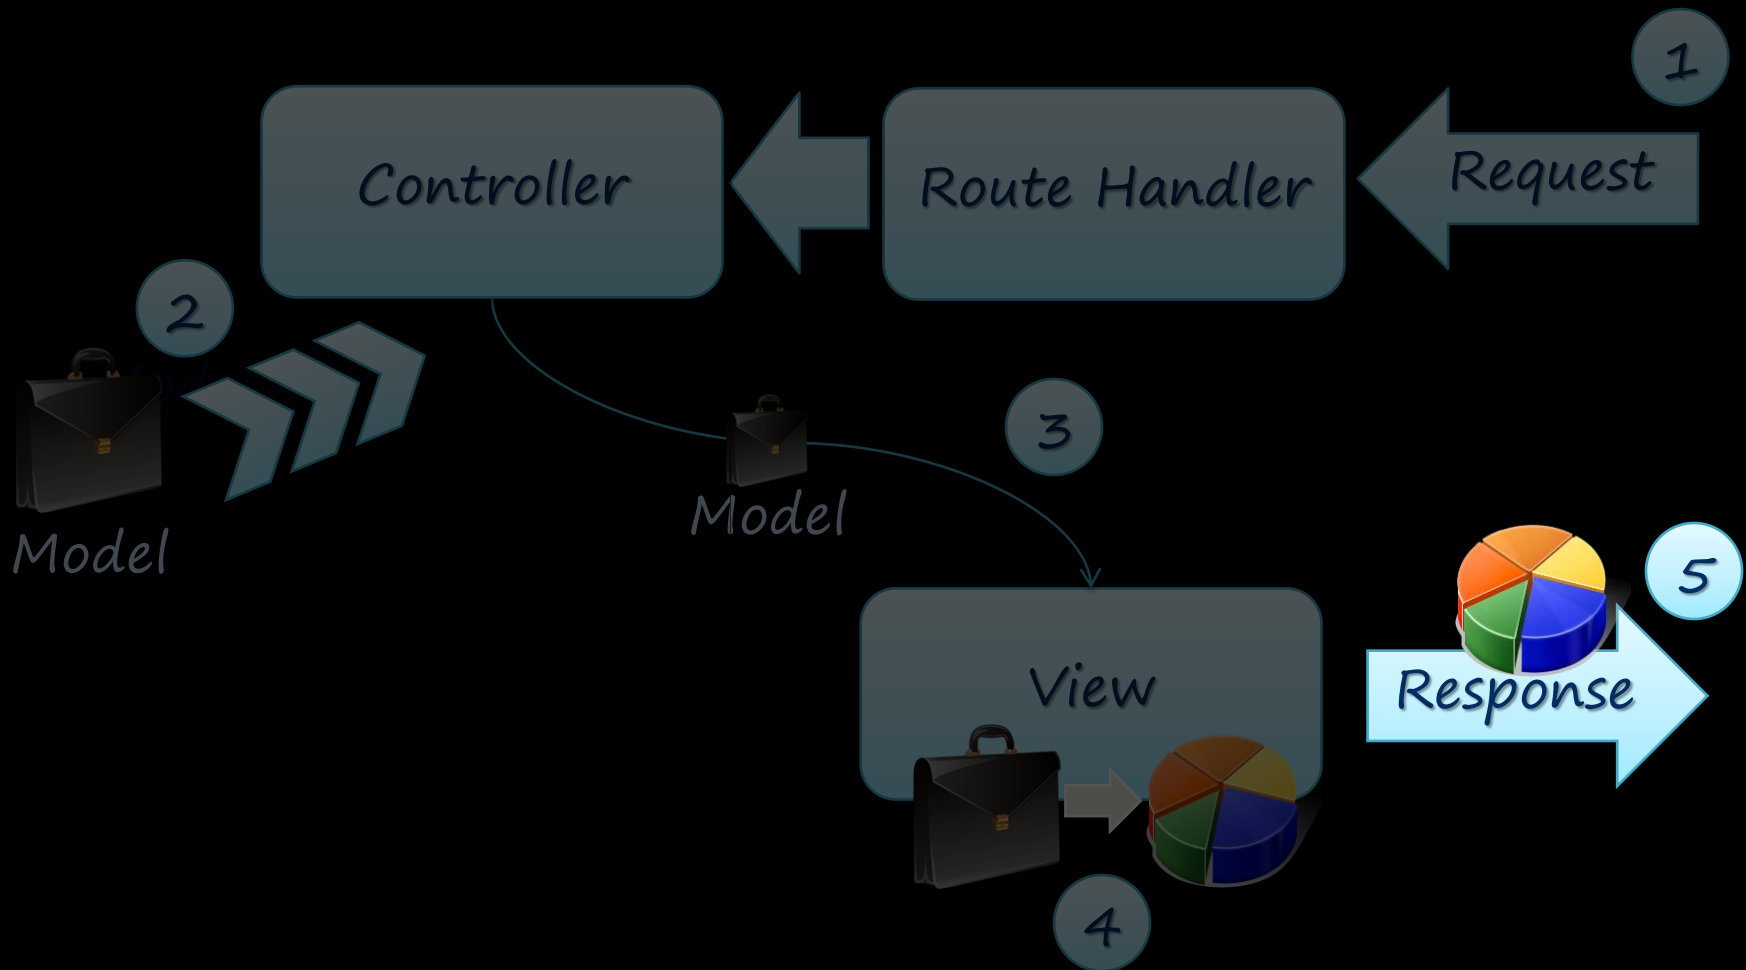

Step 3

Model is passed to **View**

Step 4

View transforms **Model** into appropriate output format

Step 5

Response is rendered

About

When you use NuGet to install a package, it copies the library files to your solution and automatically updates your project (add references, change config files, etc). If you remove a package, NuGet reverses whatever changes it made so that no clutter is left.

Important Notice

You can develop your own package and share it via the NuGet Gallery. Read the documentation for more details on [how to create and publish a package](#). If you don't plan on submitting a package, there's no need to register.

NuGet 1.5 released!

Take 5 minutes and UPGRADE NOW using the Visual Studio Extension Manager. Why? Because there's a pile of new features and it will make your life easier!

All these details and [more here...](#)
