## POLL:

what type of infrastructure are you running on?

- On Premise
- Colocation
- Root Server
- Cloud

## what is special about the cloud ??

*Every day, AWS adds* enough server capacity to power the whole \$7B enterprise Amazon.com was in 2004. Weekends included.

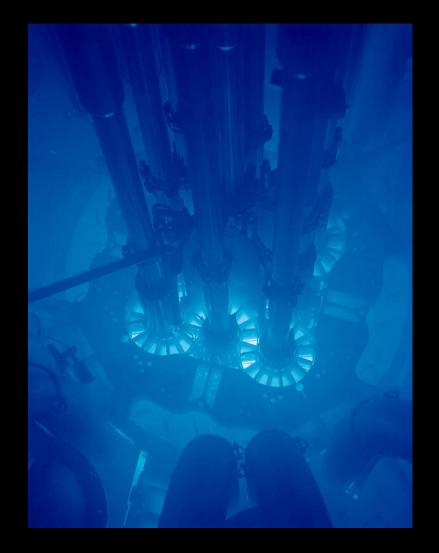

## Control Plane

#### **Control Plane**

#### Data Plane

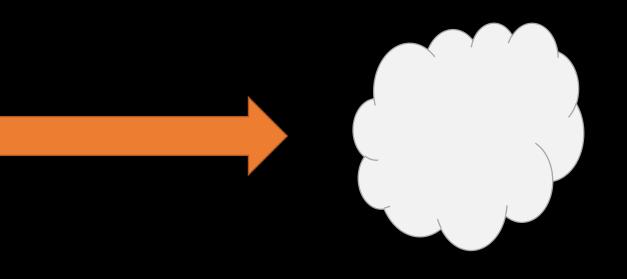

## benefits of the cloud

- ✓ Shift to a world of abundance (no more resource scarcity)
- ✓ Clean Control Plane/Data Plane split with API-based provisioning
- Cost-based Architectures
   with the ability to turn infrastructure off

## moving to the cloud

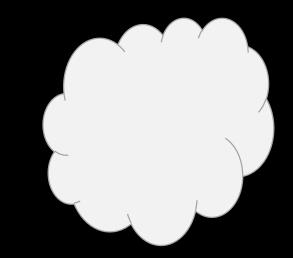

#### lift & shift (= the naïve approach)

#### lift & shift (= the naïve approach)

Congratulations! You now have:

- A more expense Hetzner/OVH
- Lots of (too much?) trust in your cloud provider
- Potential legal trouble due to data privacy laws

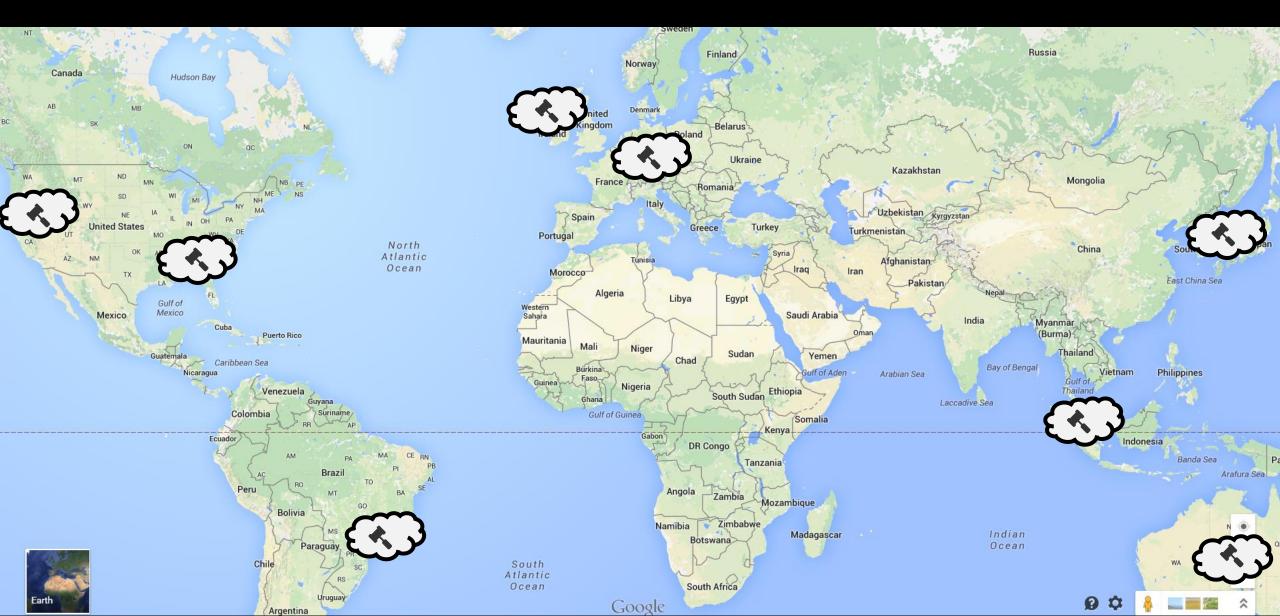

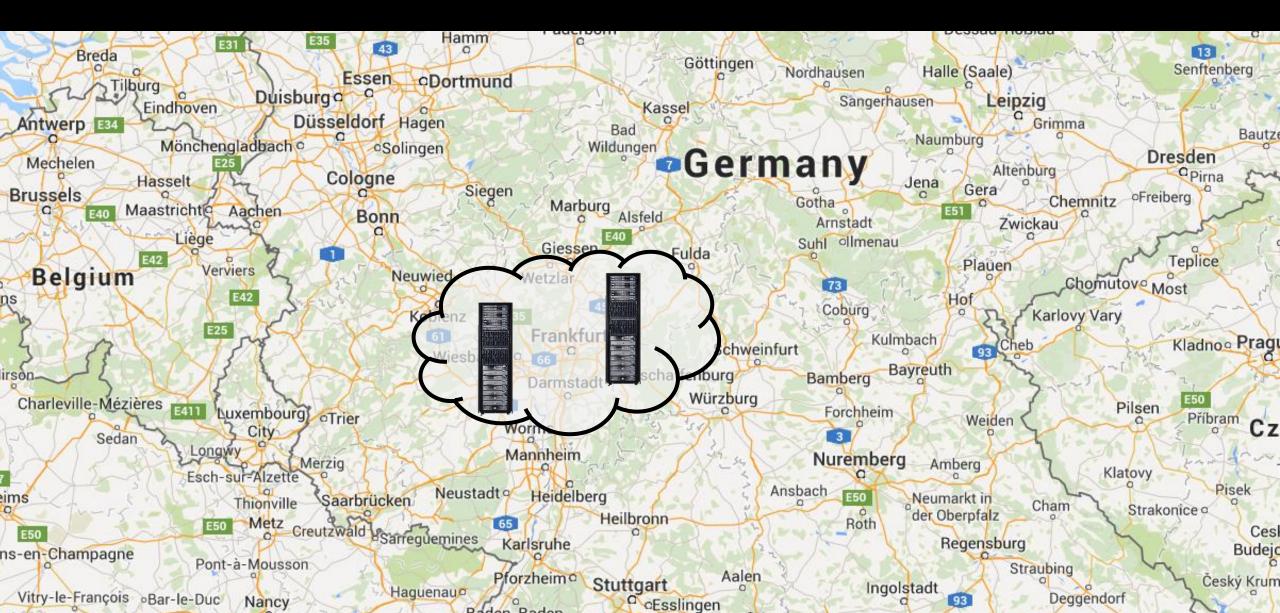

## understanding the cloud

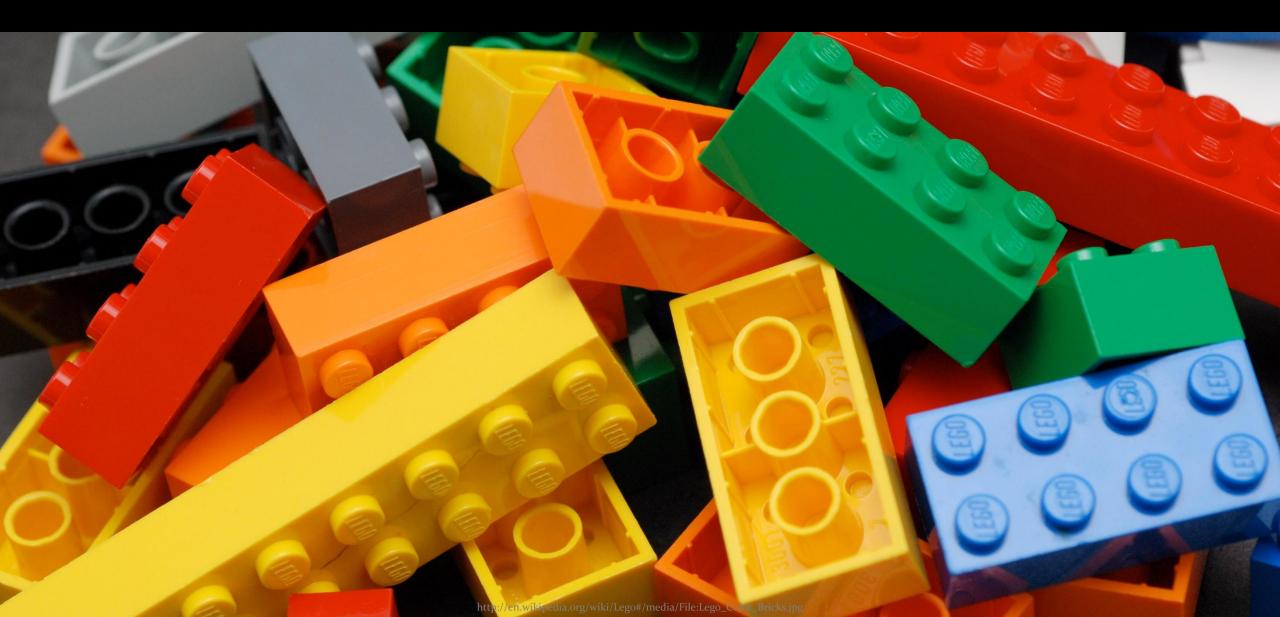

#### regions

## availability zones

## building blocks

## building blocks

## The hard Truth about Security

1. Always breakable with infinite time & resources

2. Must make it more complicated/expensive to break than it's worth (use defense in depth!)

3. Has a usability cost

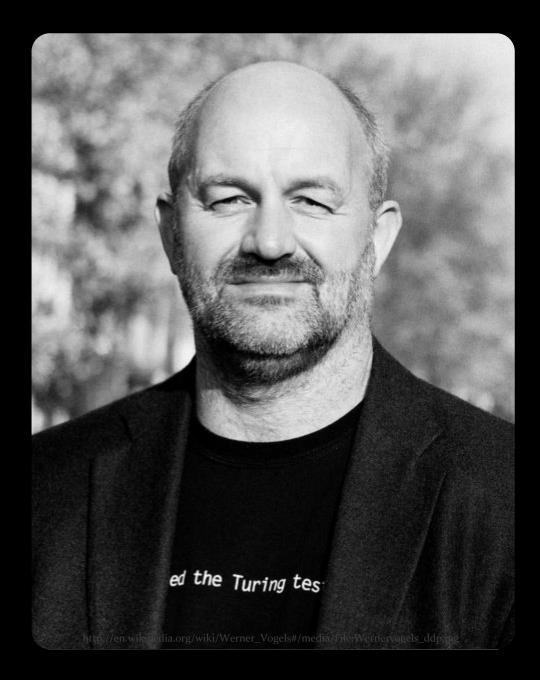

4. Almost always about the data

#### the 3 states of data

Trusting your neighbors is good. But it's even better to put a good lock on the door.

#### Werner Vogels CTO of an online book shop

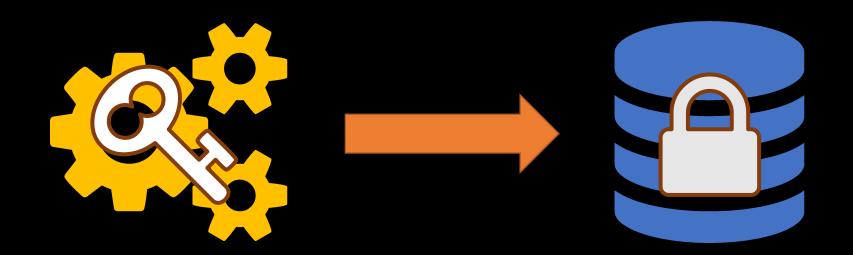

#### Data in Motion

## TLS / SSL

#### Data in Use & at Rest

Client-side encryption

## Client-side encryption

- Encrypt sensitive & personally identifiable data
- ✓ Use different Encryption key for each field/record
- Encrypt Encryption Key using Key encrypting Key
- ✓ Secure & Rotate the Key encrypting Key

#### Key Management

## Querying Encrypted Data

Id	Encrypted
123	#!azw\b
456	67ftf6 <b>&amp;</b> )

Hmac	Encrypted
5841545832	#!azw\b
0219237127	67ftf6 <b>&amp;</b> )

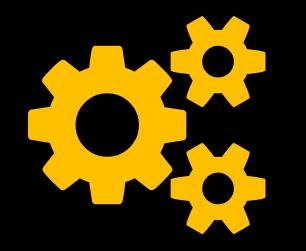

Low Fi	Encrypted
48.5	#!azw\b
37.2	67ftf6 <b>&amp;</b> )

Other clear text field

Exact Match => Hmac Range => Lower fidelity

=> Use transparent persistence layer converters!

## Compute

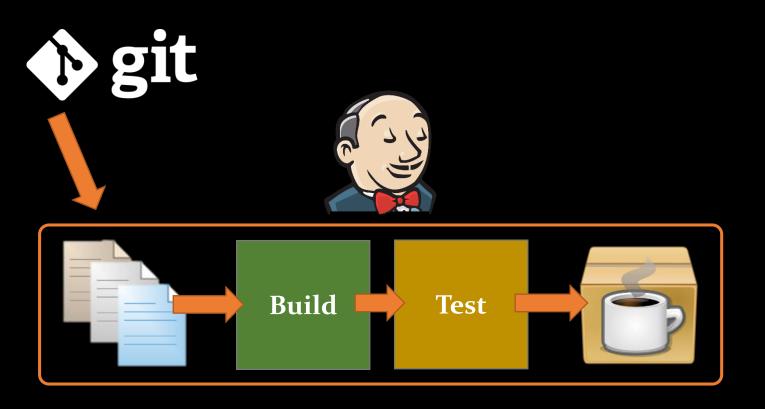

## POLL:

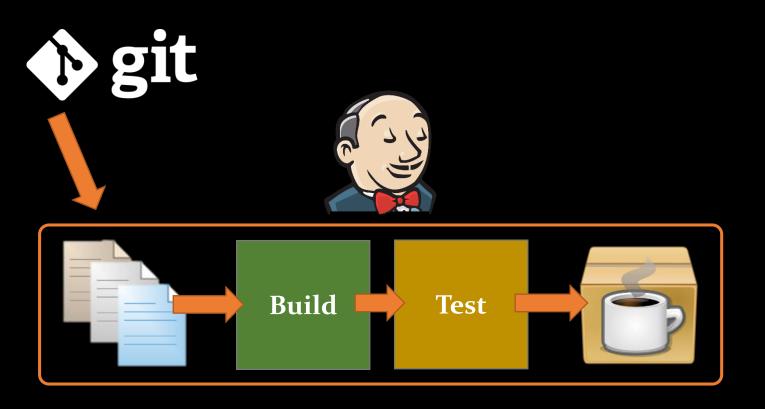

## which level of automation are you at?

- Build
- Unit Tests
- Continuous Integration
- Acceptance Tests
- Continuous Deployment (Code)
- Continuous Deployment (Code + DB + Configuration)
- Infrastructure

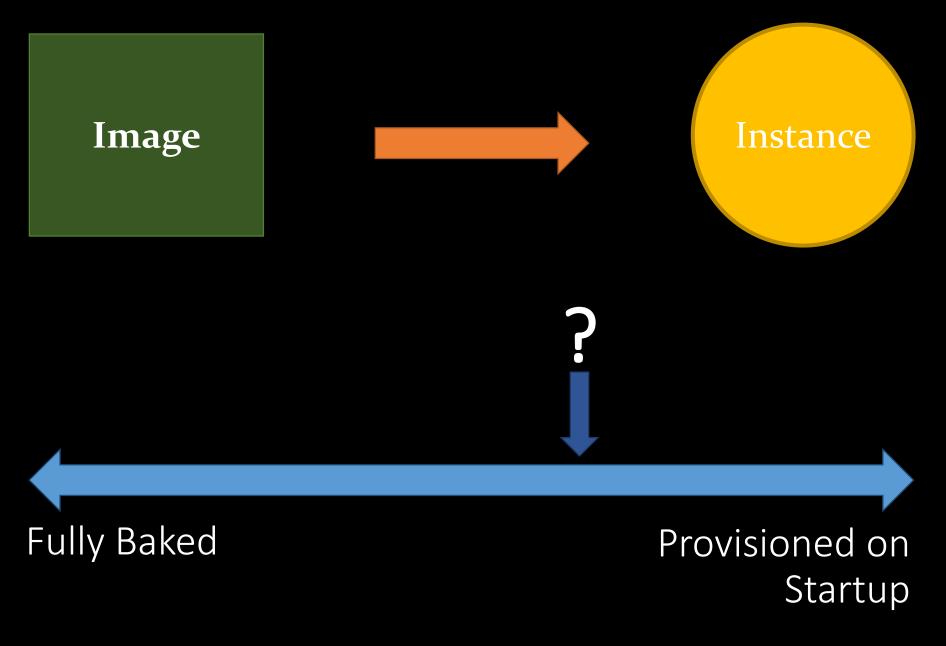

## • One immutable unit

- Regenerated after every change
- Promoted from Environment to Environment

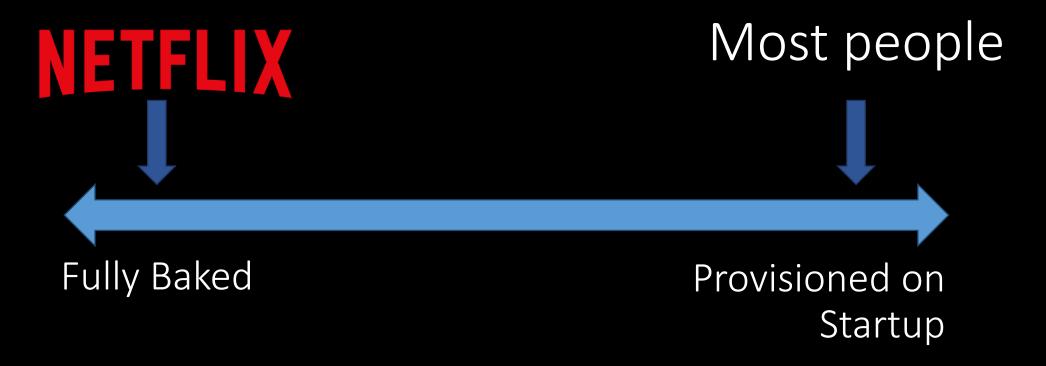

#### Classic Mistake: Build per Environment

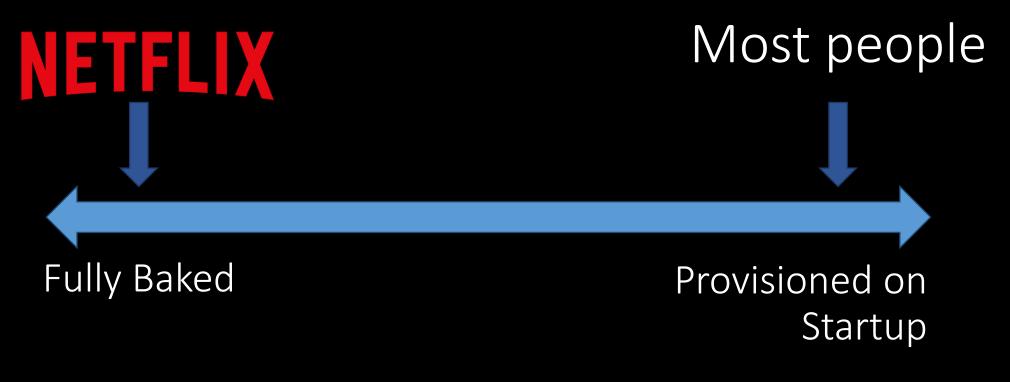

- ✓ Every Instance 100% identical
- ✓ Fastest startup
- ✓ Launch always succeeds

- ✓ One immutable unit
- ✓ Regenerated after every change
- Promoted from environment to environment

- ✓ One immutable unit
- ✓ Regenerated after every change
- Promoted from environment to environment

Fully Baked

- ✓ One immutable unit
- ✓ Regenerated after every change
- Promoted from environment to environment

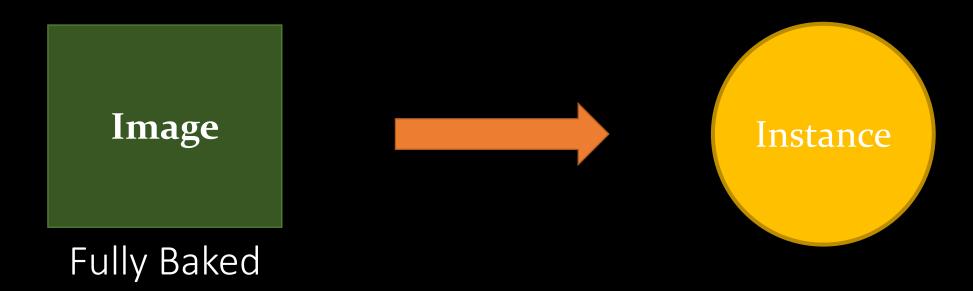

- ✓ One immutable unit
- ✓ Regenerated after every change
- Promoted from environment to environment

Fully Baked

## keep your instances stateless

# high uptime is a liability

A

10

axel@Ubuntu-1204-precise-64-minimal:~\$ uptime -p
up 14 weeks, 5 days, 2 hours, 47 minutes
axel@Ubuntu-1204-precise-64-minimal:~\$

The longer an instance is up, the harder it becomes to recreate exactly (and it will fail eventually!)

## Focus shift

## Individual instances become disposable

## Treat servers like cattle instead of pets

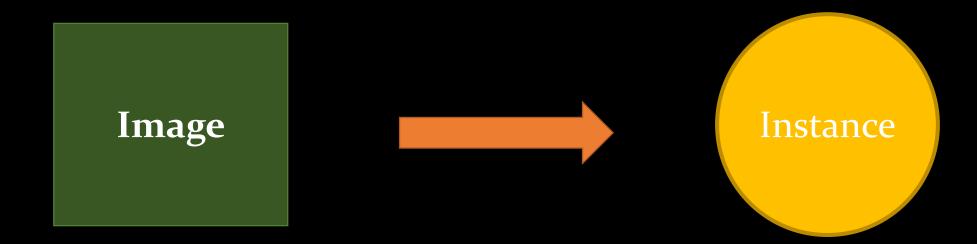

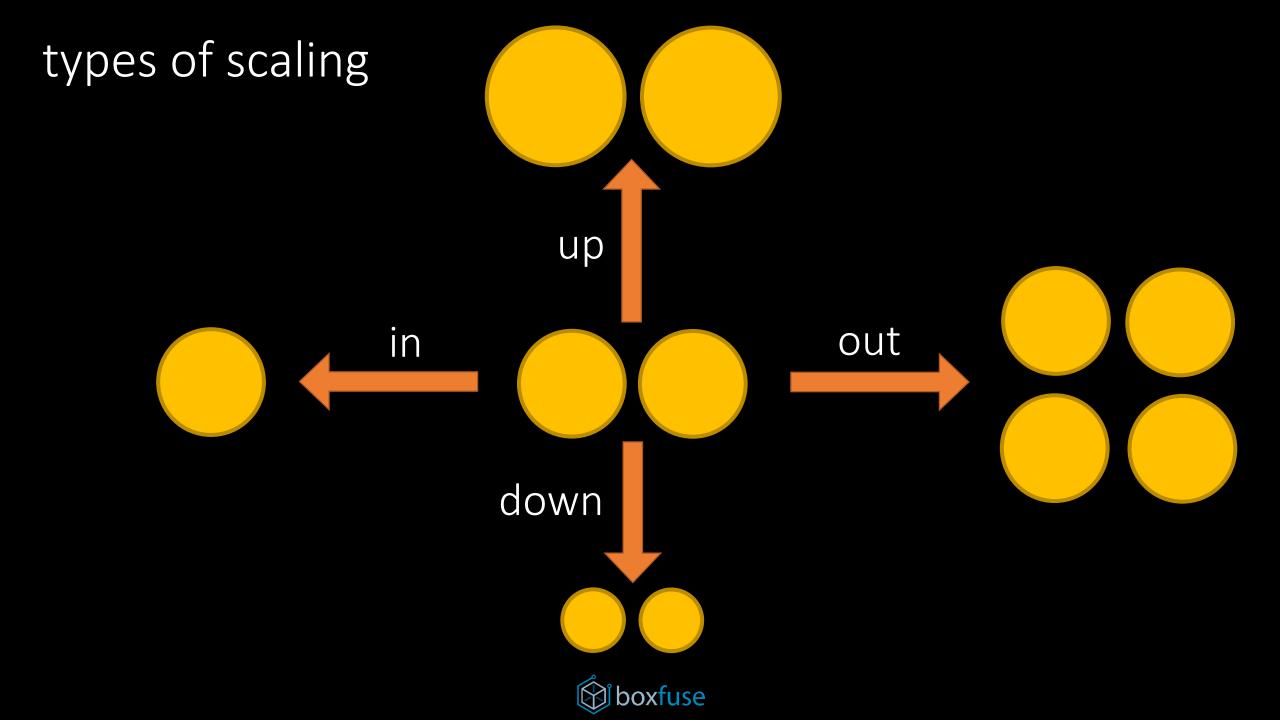

## What are the implications ???

# scaling

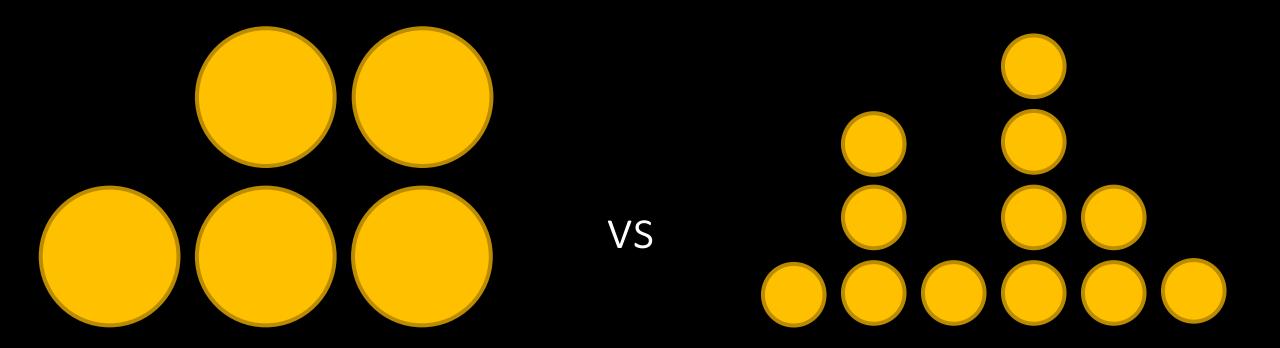

## scaling triggers for different types of services

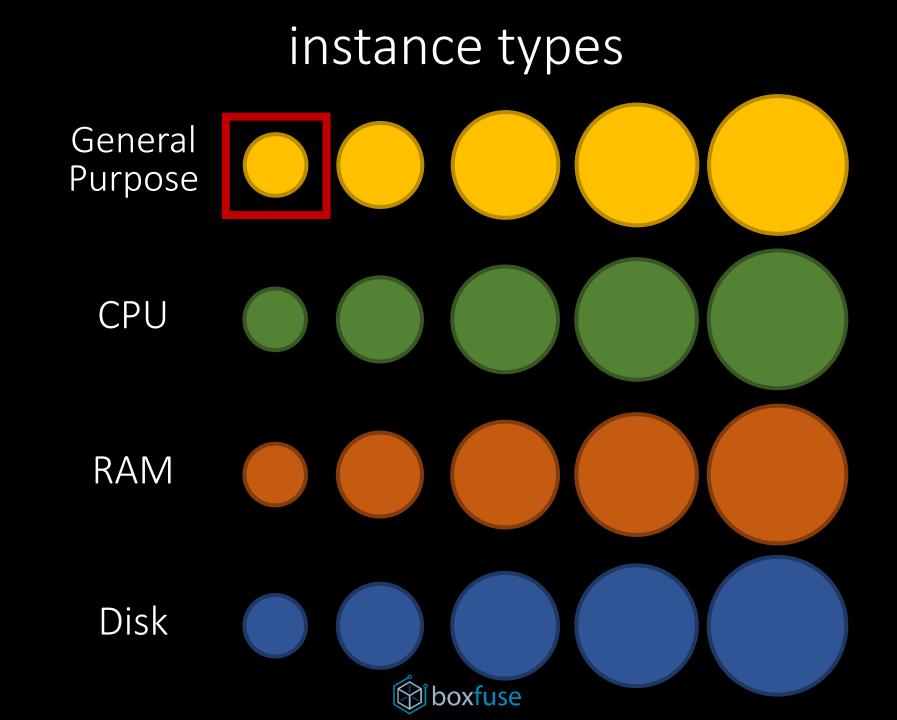

## scaling & costs

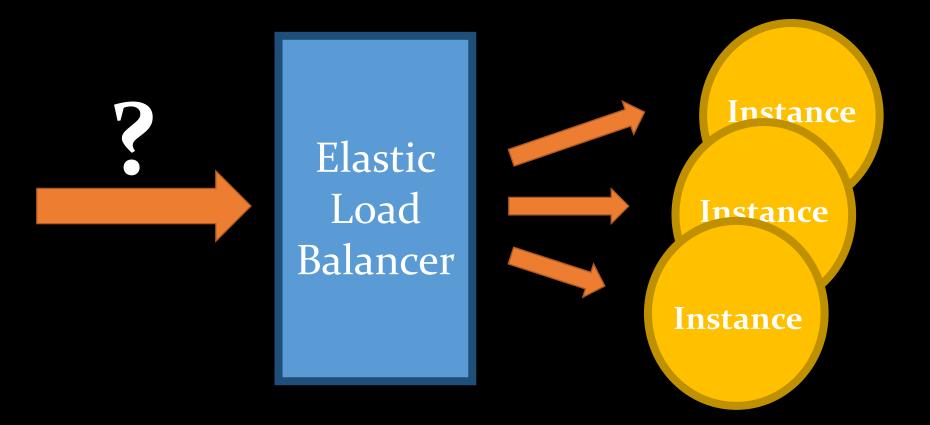

## prefer smaller granularity

## How to solve service discovery ?

Use a stable entry point with an internal registry

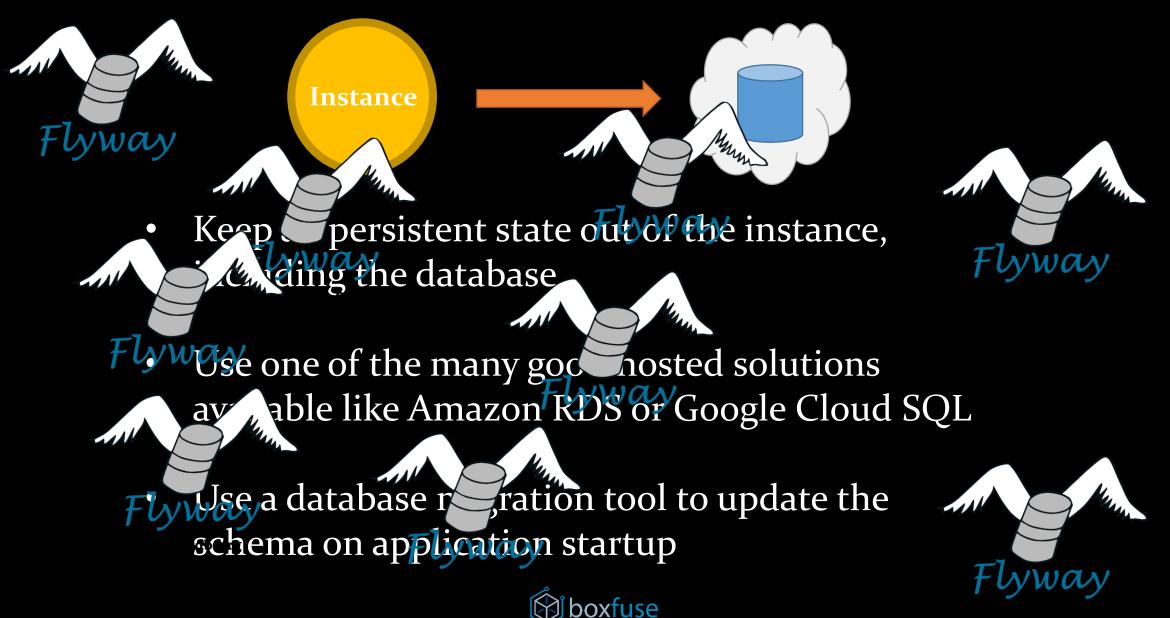

## what about configuration ???

- Bake as much configuration as possible for all environments directly in the Image
- Use environment detection and auto-configuration
- Pass remaining configuration at startup and expose it as environment variables

Key	Value
JDBC_URL	jdbc:
ENV	prod

## what about the database ???

## what about the logs ??? ssh me@myserver1 tail -f server.log

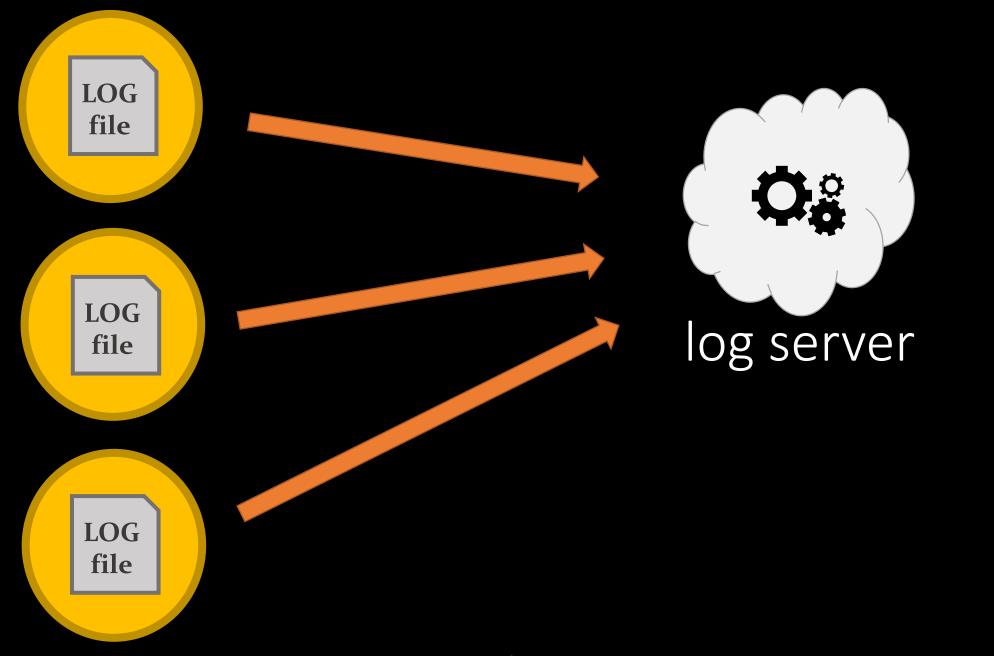

ssh me@myserver2 tail -f server.log

ssh me@myserver3 tail -f server.log

#### Ship logs to a central log server

#### where they can be

- aggregated
- stored and backuped
- indexed
- searched through a nice web UI

### Many good hosted solutions

- Loggly
- Logentries
- Papertrail
- •

boxfuse

=> Think about data privacy!

## what about sessions ???

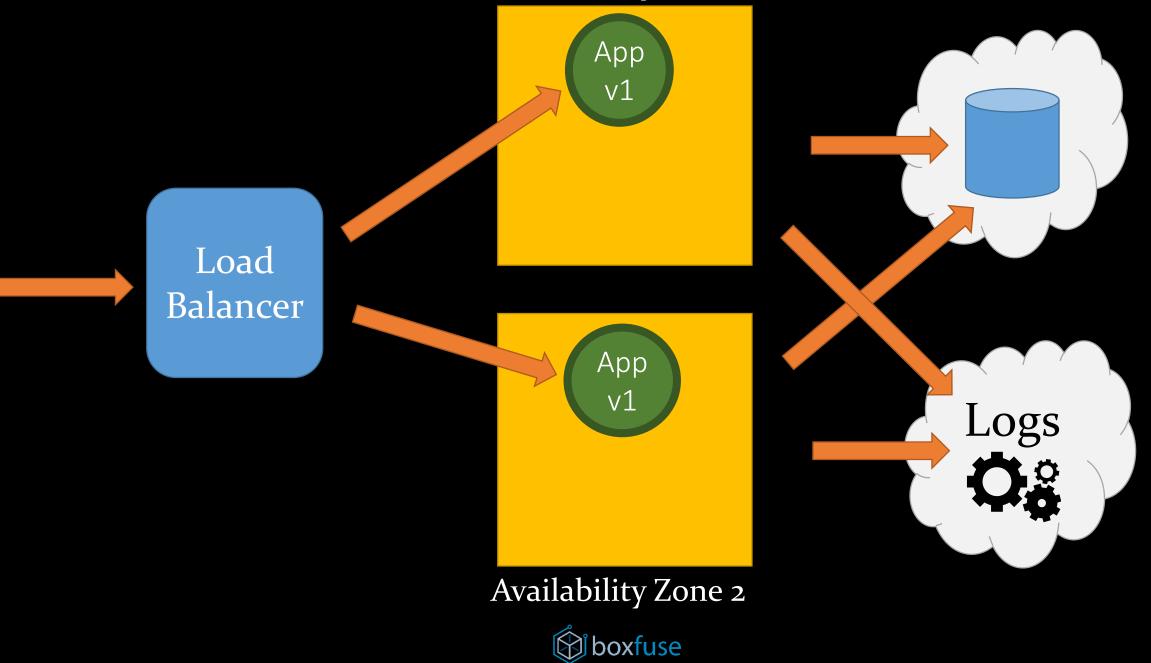

Keep session in an encrypted and signed cookie

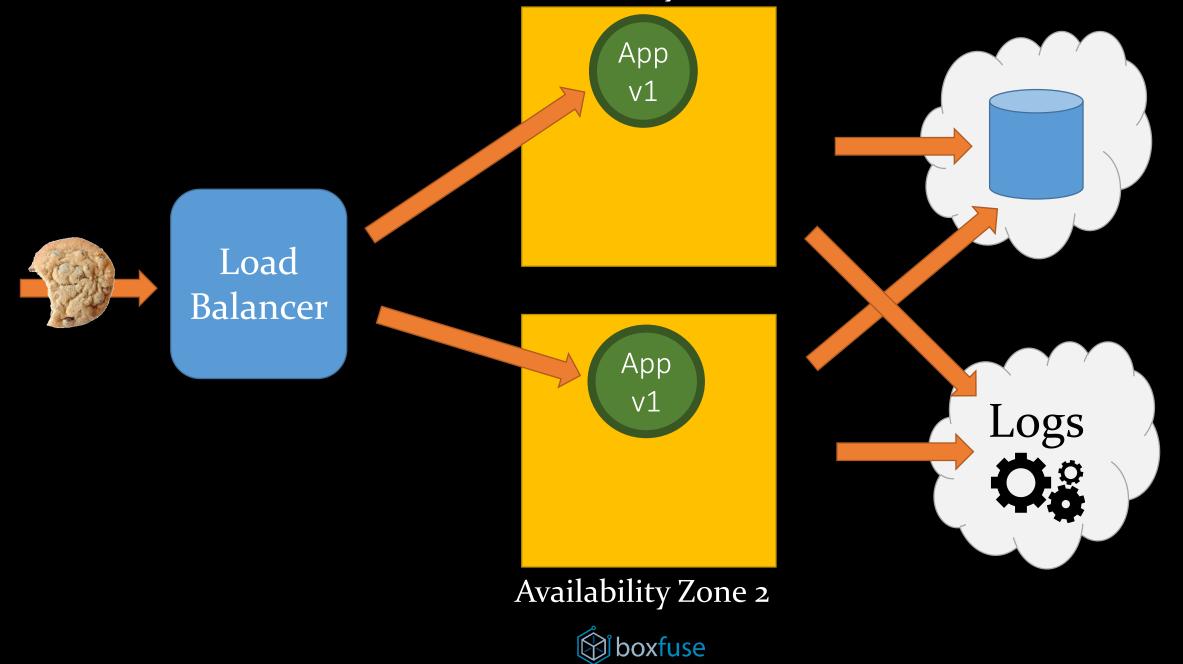

- avoids session timeouts
- avoids server clustering & session replication
- avoids sticky sessions & server affinity

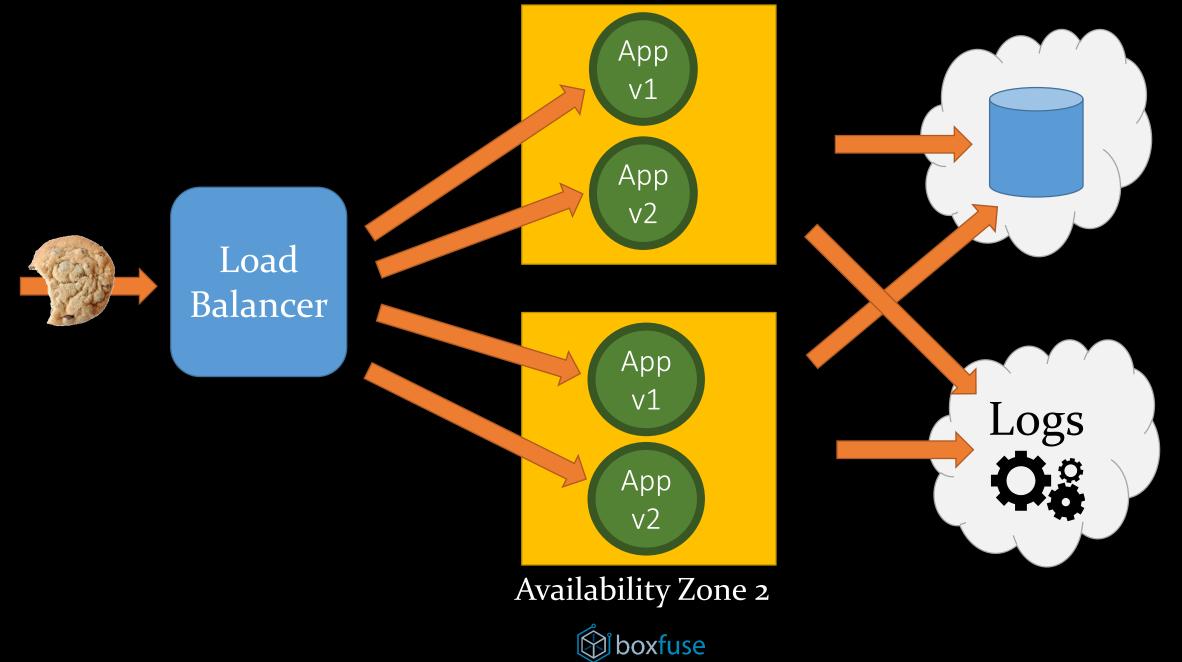

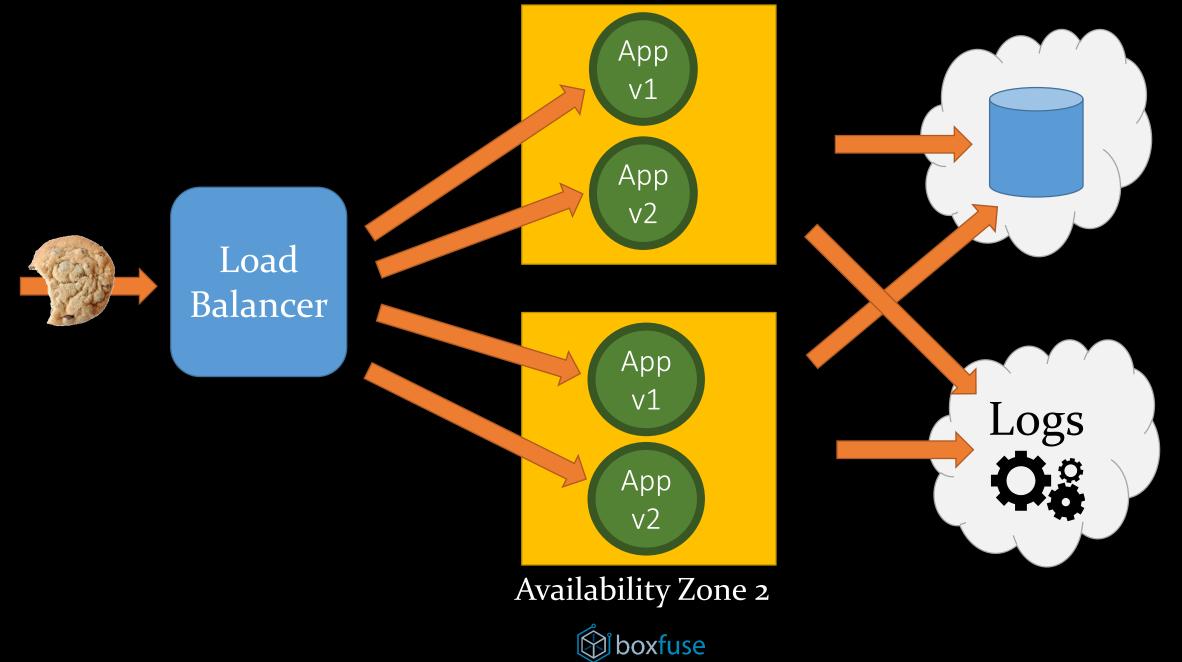

## what about rolling out new versions ???

## what about containers ???

## understanding modern CPUs

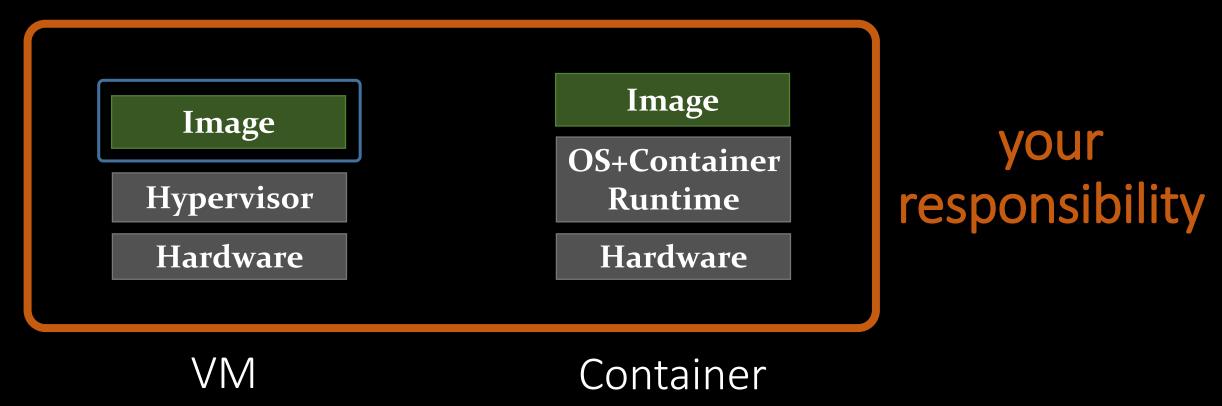

Both Intel and AMD have hardware support for virtualization

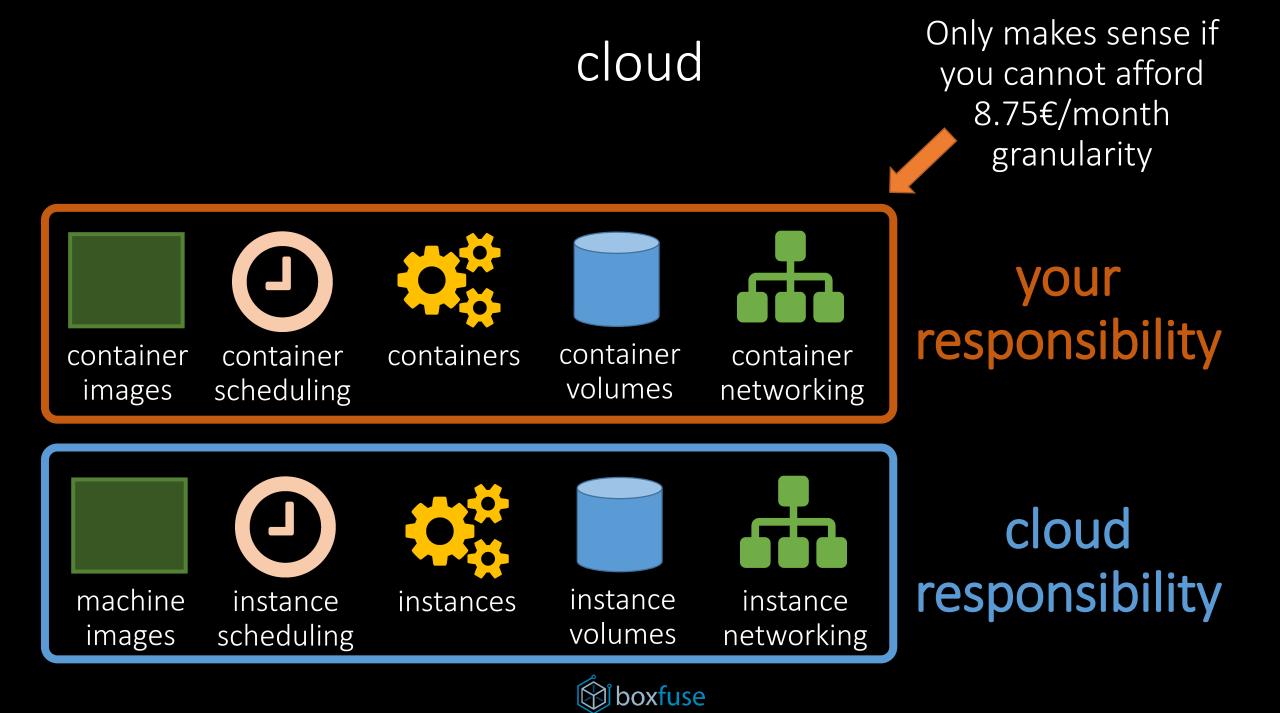

- isolation
- performance

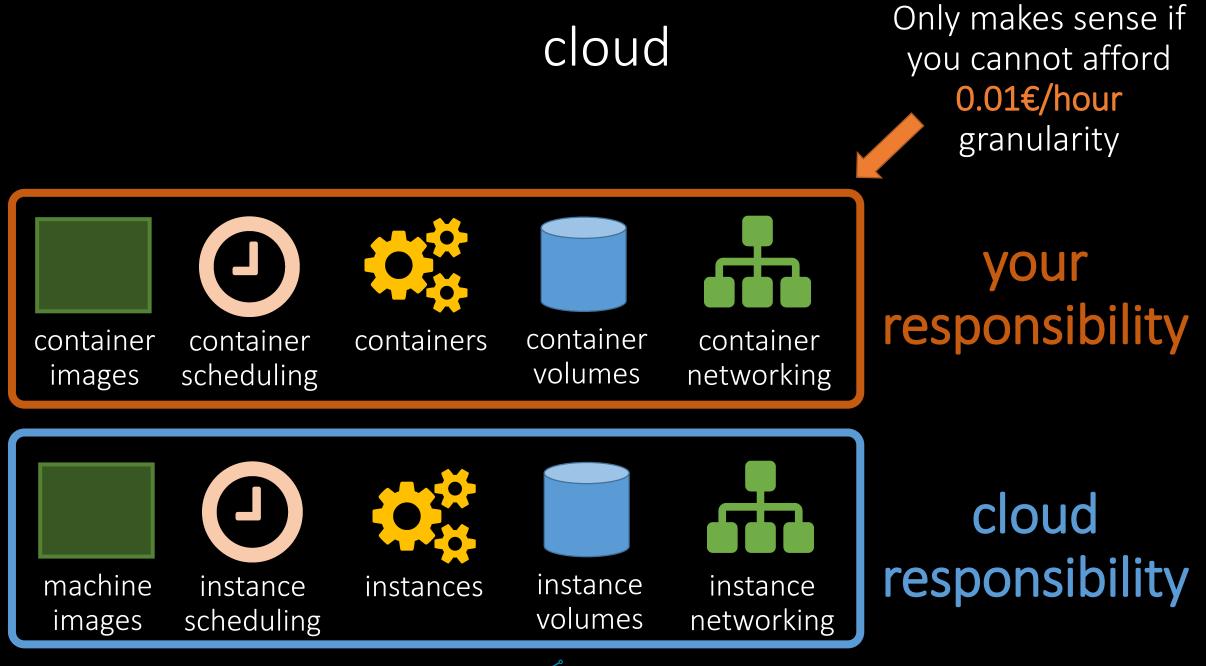

## on prem

boxfuse

## summary

- ✓ Put a good lock on the door (use encryption!)
- ✓ Use fully baked images (build once!)
- ✓ Treat servers like cattle (disposable!)

boxfuse

boxfuse.com

- Fully baked images generated in seconds (not minutes or hours)
- Optimized for JVM apps (Spring Boot, Dropwizard, Tomcat, TomEE, ...)
- Minimal images just 1% of size of regular OS (measured in MB not GB)
- Images work on VirtualBox & AWS (environment parity from dev to prod)
- Zero downtime updates on AWS (fully automatic blue/green deployments)

## final disclaimer

# no animals were harmed while making this talk ③
