Better Problem-Solving and Decision-Making with absolutely no mention of architecture or design or quantum physics – sorry 😞!

Linda Rising
linda@lindarising.org
www.lindarising.org
Disclaimer: This provocative presentation is ideally the beginning of a conversation. It won't take long for me to tell you everything I know about cognitive psychology, although I have been reading in the area for several years now. I'm an amateur who has sufficient interest in weird topics and a strange way of connecting ideas that might or might not be of interest to you. Thank you for your tolerance and understanding of my meanderings and I hope you learn a little that might help you in your life.

This is not an “academic” presentation, but those interested in more information are invited to ask me for references for any part of this talk and I will be happy to make them available.

Scientists and journals prefer positive findings and bury negative studies. Always be a little skeptical!
Call for insights!

An article series in IEEE Software
Stories, case studies, experiences

Cadel Evans!
What is thinking?
Any thinking or decision-making happening here?
Are there similarities in these two settings?

Sitting
Focused attention
Inside – no connection with Nature
Drab, probably noisy surroundings
Individuals probably tired, over-caffeinated
My goal: useful tips and techniques

Cognitive science is fast growing, uses controlled experiments, on-going re-testing, explosion in results

Our field is slow growing, few, if any controlled experiments (mostly anecdotes, case studies)

We should pay attention – it might help us do our work better 😊!
Move!

Blink, look at the horizon, turn your head, move your eyes from side to side, look around, look outside

Stand up, stretch – companies experimenting with stand-ups

Lie down

Exercise – even 5 minutes

Sitting kills 😞!
Treadmill Desk
Take a Break

Bio break, coffee break (caffeine is the subject of another talk), smokers’ edge 😊!

Walk – effective persuasion technique – walk sideways or backward

Take a nap (subject of another talk)

Work on a different hard problem - multi-tasking is ineffective (can you listen to two songs at the same time?) but shifting focus can help
When Arianna Huffington is looking for inspiration, she goes to sleep. "There are many, many great ideas locked inside of us," she says. "We just need to close our eyes to see them."

There are three nap rooms in the offices of the Huffington Post Media Group.
Do “Nothing”

When people constantly bombard their brains with digital input, they are forfeiting downtime that could allow them to better learn and remember information, or come up with new ideas.

Processing a barrage of information leaves people too fatigued to learn.

The brain needs downtime.

We think we’re relaxing by distracting ourselves, but we’re fatiguing our brains.
“My commute is my most productive creative time when I’m not focusing on anything.”

Chris Cox, Facebook’s Product Chief
Drink, Eat

Even mild dehydration affects the brain – always have water on hand – watch the caffeine

Decision-making requires energy, if tired and hungry people are forced to make decisions, they look for the easy way out

Study of judges granting more favorable verdict after breaks
Nature Nurtures

Plants (must be the real thing, not photos or displays) improve innovative and creative thinking

Looking outside improves health

Walking outside, even for a few minutes, improves decision-making (better than walking in urban areas)
Cardboard consultant

Explain the problem out loud to something or someone else – a stuffed animal, a photo, or another person who does not have to understand what you are talking about 😊!

Use this technique in meetings – have proposers of different solutions explain their version of the problem (not the solution!) to others
Write, Draw, Sketch

Typing is the least effective means for description

Writing by hand is useful for solving problems of all kinds

Drawing, sketching are also helpful – research shows that doodlers remember more information than note-takers – encourage doodling at meetings!
Happy people are more productive

Posture – sit up, both feet on the floor, arms open, pull work toward you, nod your head

Smile – research shows this to be as effective as anti-depressants 😊! Fake it!

Language – choose affirming words “like,” “positive,” find areas of agreement, “yes, and”
Be mindful of the environment

New research suggests that we are sensitive to our environment – sitting in a hard vs. soft chair or the weight of a document influences how “hard” or “weighty” we believe an issue to be.

Temperature of the room or drinks influences how we feel about others around us.

Higher ceilings increases innovation. Lower ceiling concentrates on details.

Noisy environments are harmful.
Art spurs innovation
Brainstorming

Brainstorming “invented” in the 1940s – is intuitively appealing – we all get together and follow some simple rules to generate innovative ideas

Research shows that individuals working on their own produce a higher quantity/quality of ideas than those in groups and avoids “social loafing” and “groupthink”

Stressed people tend to conform more to social opinion.
Solomon Asch Experiment
More effective than brainstorming

Quiet storming after preparation
Independence is a requirement for individual action
Diversity!

Have more women on the team or involved somehow.

Preliminary research shows higher quality collaboration, changes the behavior of the male members, increases group intelligence and overall performance.

http://hbr.org/2011/06/defend-your-research-what-makes-a-team-smarter-more-women/
Small Steps

We have a sense that large, complex problems require large, complex solutions.

Organizations and software are examples of complex systems where the impact of any change is difficult to predict.

The often-overlooked approach of Small Steps (it’s a pattern!) is a better road to success where the result of each small experiment can be seen before the next step is taken.

Implementation intention
Cutting edge suggestions

Singing reduces stress and lowers blood pressure

Avoid buyer’s remorse - hand washing - bring a sense of closure to the decision, don’t continue to debate
Animals!

Research shows dogs in the workplace result in better collaboration within teams.
Try your own experiments

Use these patterns from *Fearless Change*:
- Test the waters
