## KEVIN HOUSTOUN,

RAPID ADDITION

---

### **Biography:** [Kevin Houston](#)

Kevin has over 20 year's experience of working within financial markets technology including Robert Fleming, LSE, Salomon Brothers and HSBC.

Kevin helped to establish the FIX protocol in Europe. His first FIX engine was given away as a learning aid that helped many enterprises further their knowledge of FIX. Kevin is the designer of the FIX Repository for FIX Protocol Limited, Co-chairs the Global Technical Committee, and is an active member of the Global Steering Committee. He is the lead Expert Group member, UK Government Foresight Committee looking at the Future of Computer Based Trading.

---

## RUPERT SMITH,

CONTRIBUTOR TO THE APACHE QPID IMPLEMENTATION OF AMQP

---

### **Biography:** [Rupert Smith](#)

Rupert Smith is a Java programmer, who started out tinkering at the low-level end of things; Assembler and C. He first worked on messaging software as a contributor to the Apache Qpid implementation of AMQP. He is currently working for Rapid Addition which, with its low-latency focus, is a fertile place to mix ideas from his background. He studied Computer Science at Cambridge University and maintains an interest in compiler development, particularly for logic based languages. His main hobbies are camping and nature conservation.

Rationale

Origin

Road to Gen Zero

Details

# Box Trade - \$100

USD/EUR = 1.3158

EUR/GBP = 1.1875

USD/GBP = 1.5625

Ignoring spreads, commissions  
and transaction costs

USD

100<sup>1</sup>

EUR

GBP

# Box Trade - \$100

$76^2$	$76^3$

GBP

$64^3$	$64^4$

# Origin

Wrote a repository driven engine initially used with BizTalk

What is the repository?

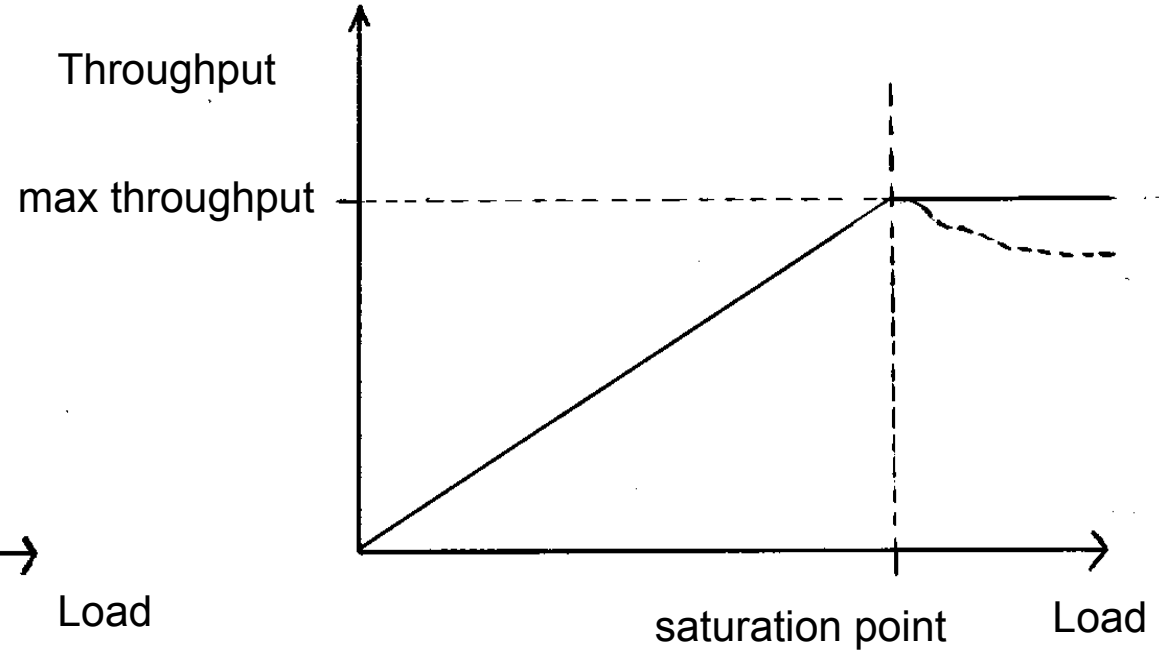

Looked a code generation to improve

Already one of the fastest engines around

GC identified as major hurdle

.Net initiative to remove

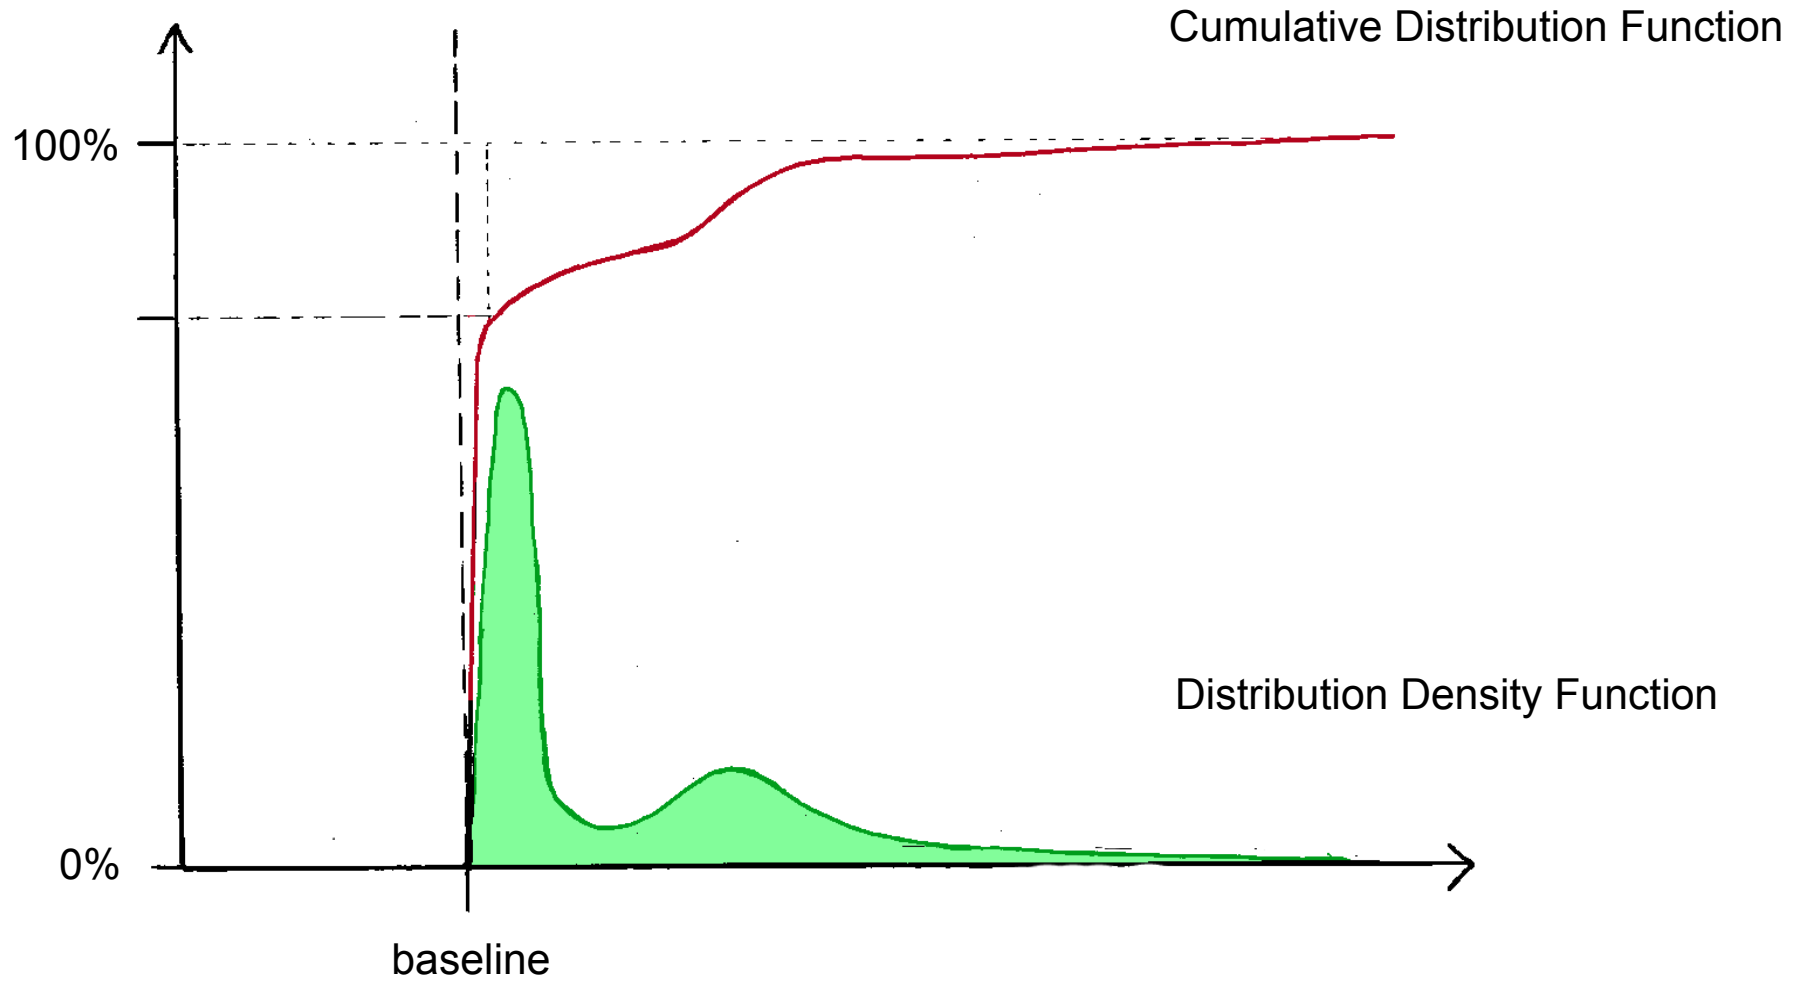

# Latency vs Load and Throughput vs Load

If you want *good latency*,  
you must have *excess capacity*.

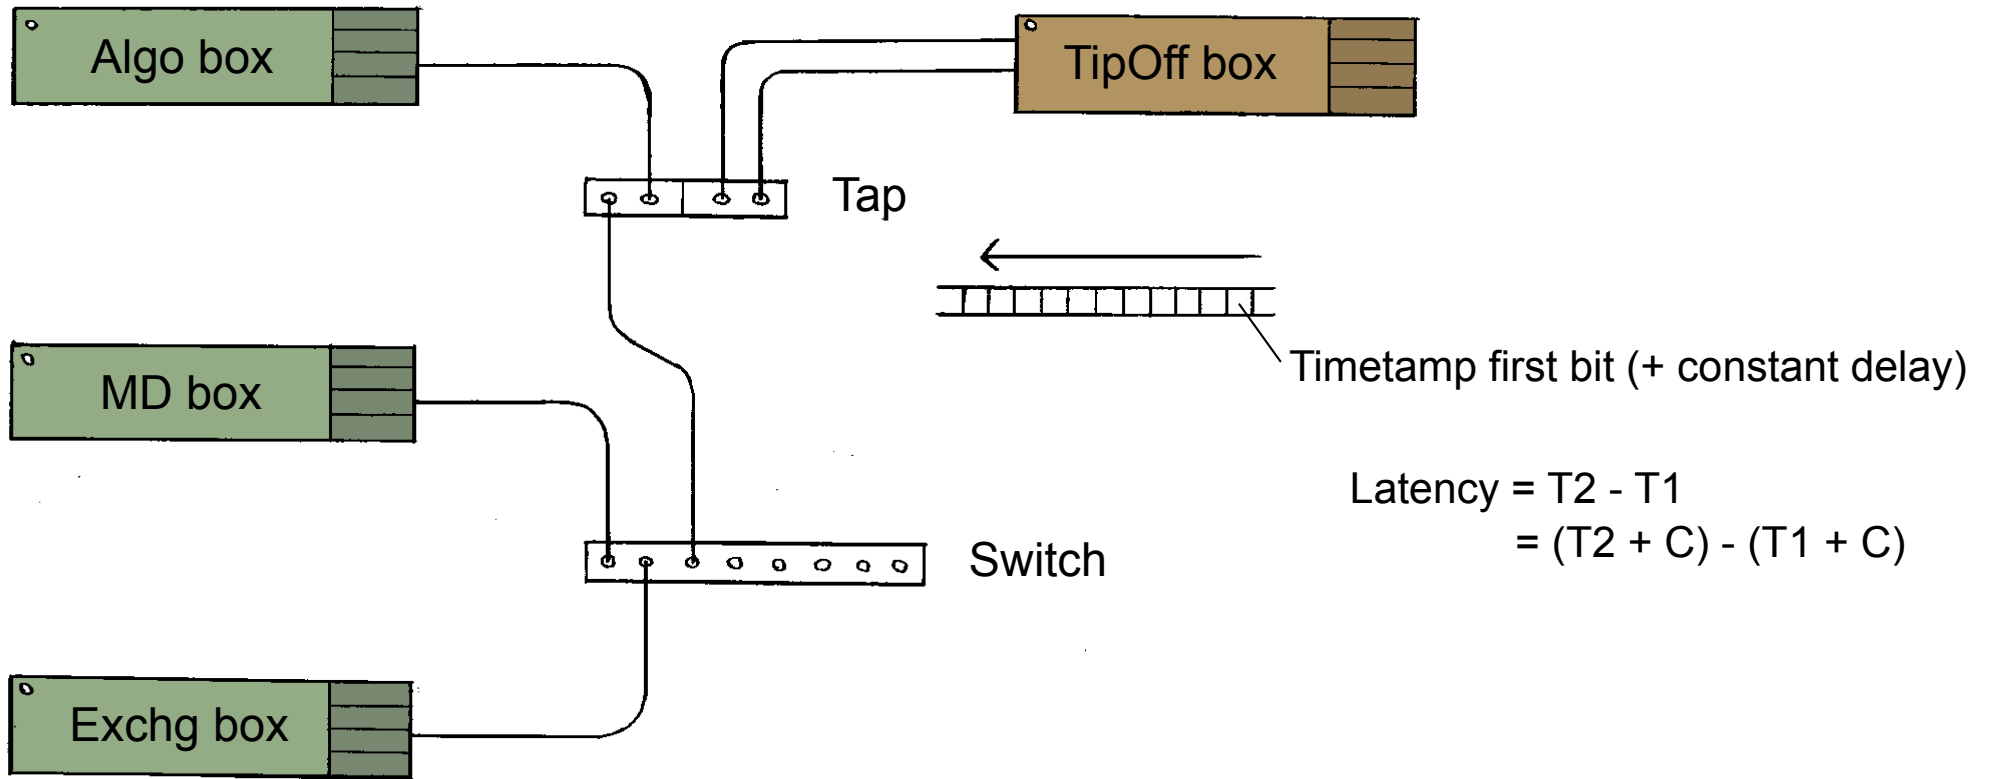

# Distribution of Latencies

Lower the baseline.  
Tighten the tail.

# The 'Algo' Trading Test

fix0\_n Market Data and Executions  
 fix1\_n Orders

$$\text{Latency} = T2 - T1$$

$$= (T2 + C) - (T1 + C)$$

5 'stocks'  
 5 ticks/cycle

1001.000 -> BUY 1  
 1002.000 -> BUY 2  
 ...  
 1001.001  
 ...  
 1001.005  
 -----  
 2001.000 -> BUY 1  
 ...

Why?

Order and Exec Report can be matched up by Client Order Id.  
 Market Data and Order have no built in correlation.

# End to End Time Budget

1G on 2.8 GHz Nehalem, built in NIC

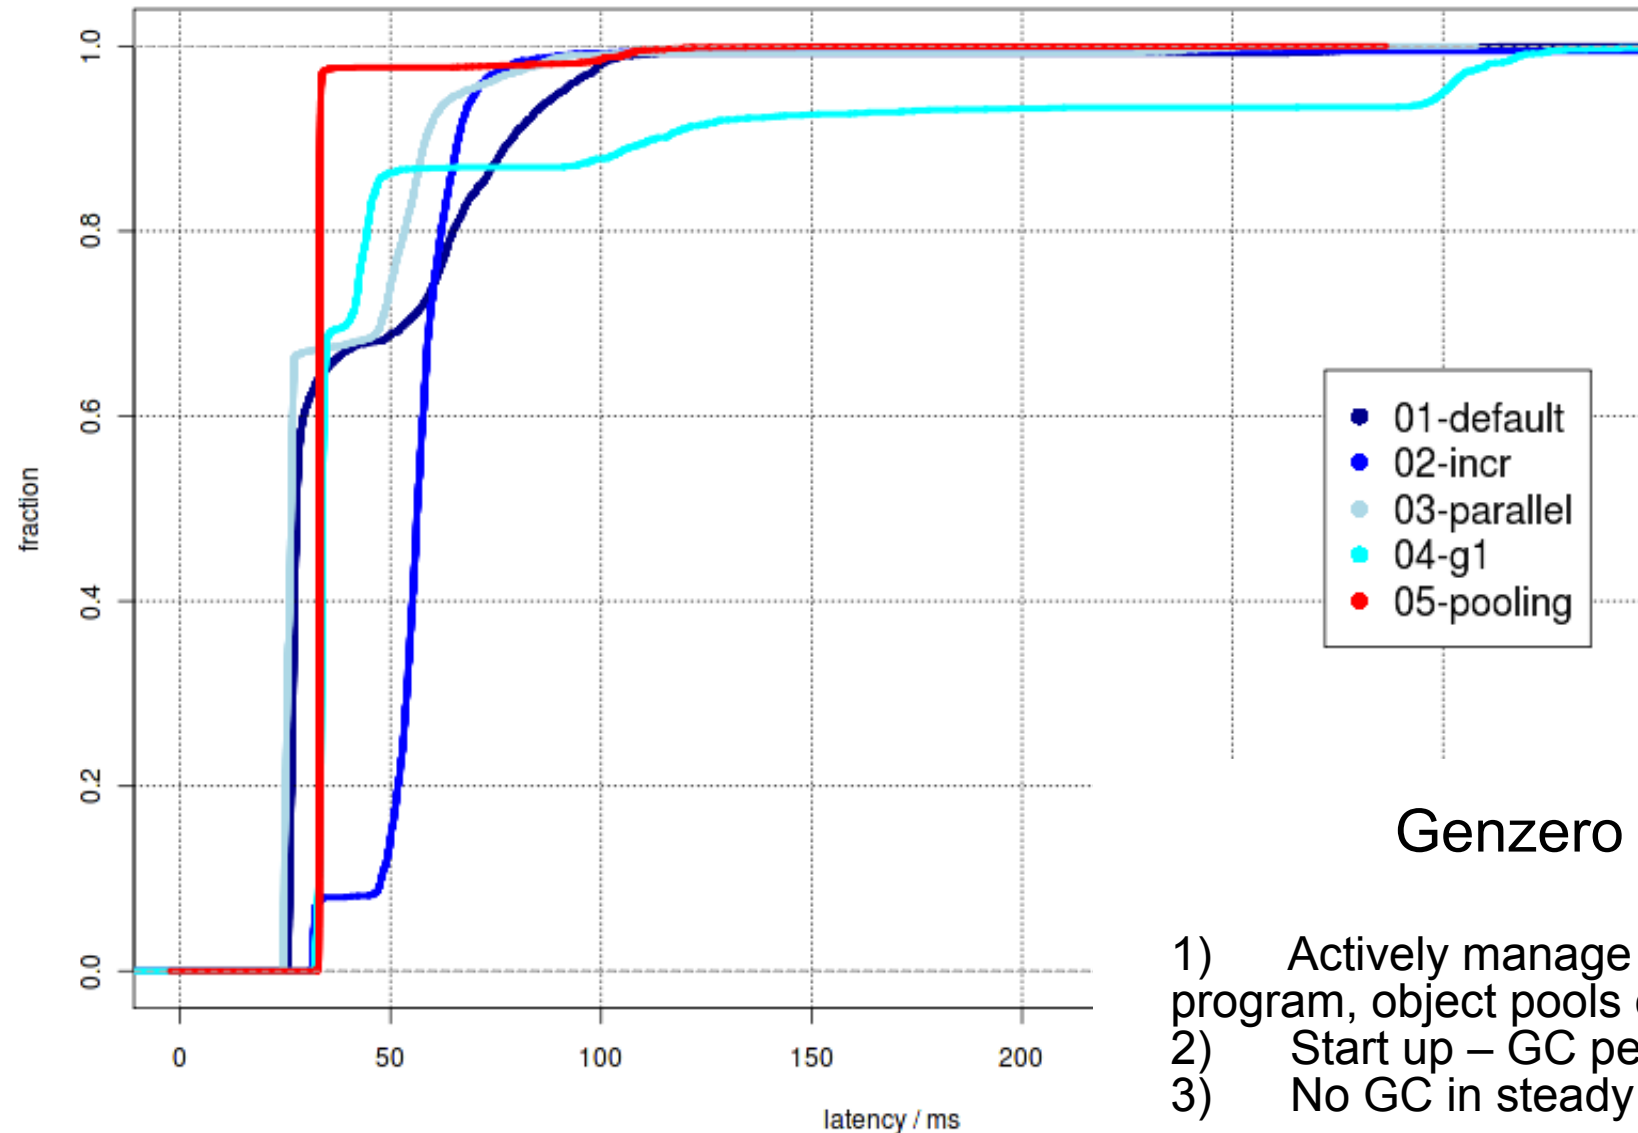

1G on 2.8 GHz, SolarFlare and 'open onload'

# Jitter and Garbage Free Code

Latency Comparison of Javolution Object Pooling vs Garbage Collection

JavaWorld article  
on Javolution

<http://tinyurl.com/69m7xz>

Compute FFT of Complex  
numbers. Requires lot of  
intermediate values; a  
source of garbage.

## Genzero Rules:

- 1) Actively manage any resources used in program, object pools etc
- 2) Start up – GC permitted
- 3) No GC in steady state phase of program

# FIX is ASCII

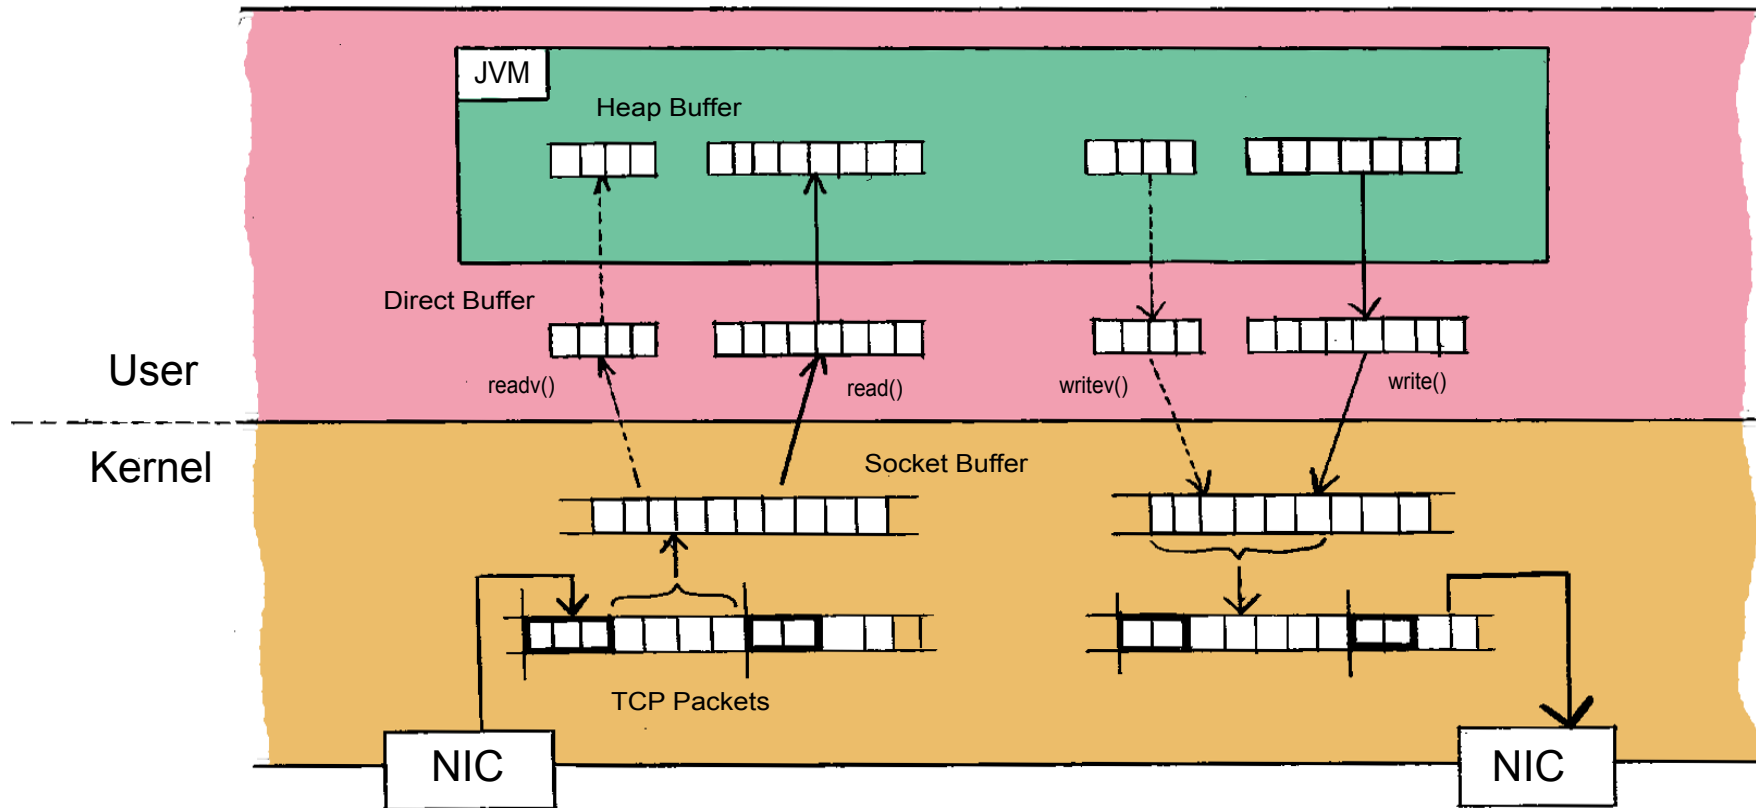

8=FIX.4.2 | 9=192 | 35=X | 49=FEED | 56=ALGO | 34=7 | 52=20120308-00:51:52.303 | 262=subscribe:A000 | 268=2  
| 279=1 | 269=1 | 278=23 | 55=A000 | 270=0.001 | 271=1000 | 346=1 | 290=1 | 279=1 | 269=0 | 278=24 | 55=A000  
| 270=0.101 | 271=1000 | 346=1 | 290=1 | 10=186 |

Subtract ASCII '0'  
Multiply by 10

Divide by 10, take modulo.  
Add ASCII '0'

Avoid using `java.lang.String` for string processing.

# Zero Copy I/O, how real is it?

Java nio provides API for zero-copy vectored I/O.

There may be copying.

Access to `byte[]` vs `getBytes()/setByte()`.

# SolarFlare Effect of 'onload' (polling)

SolarFlare onload vs not using onload, 15k Market Data msgs/sec, Price in to BUY.

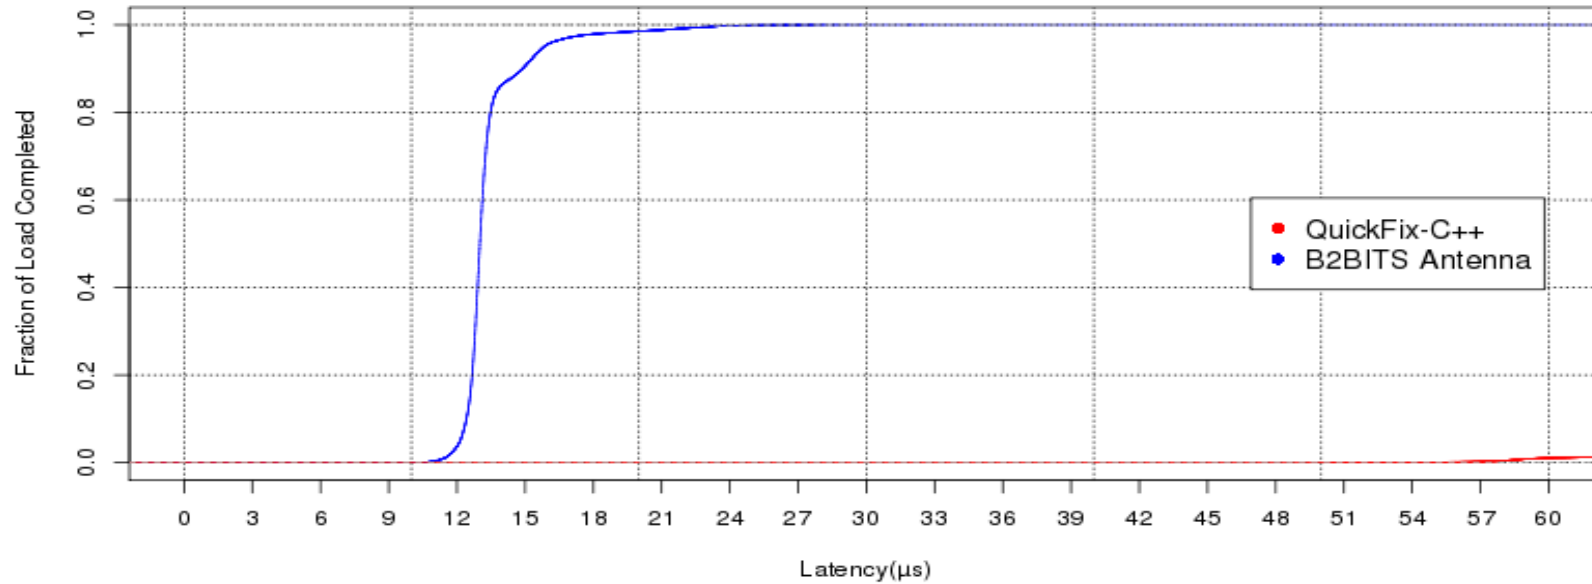

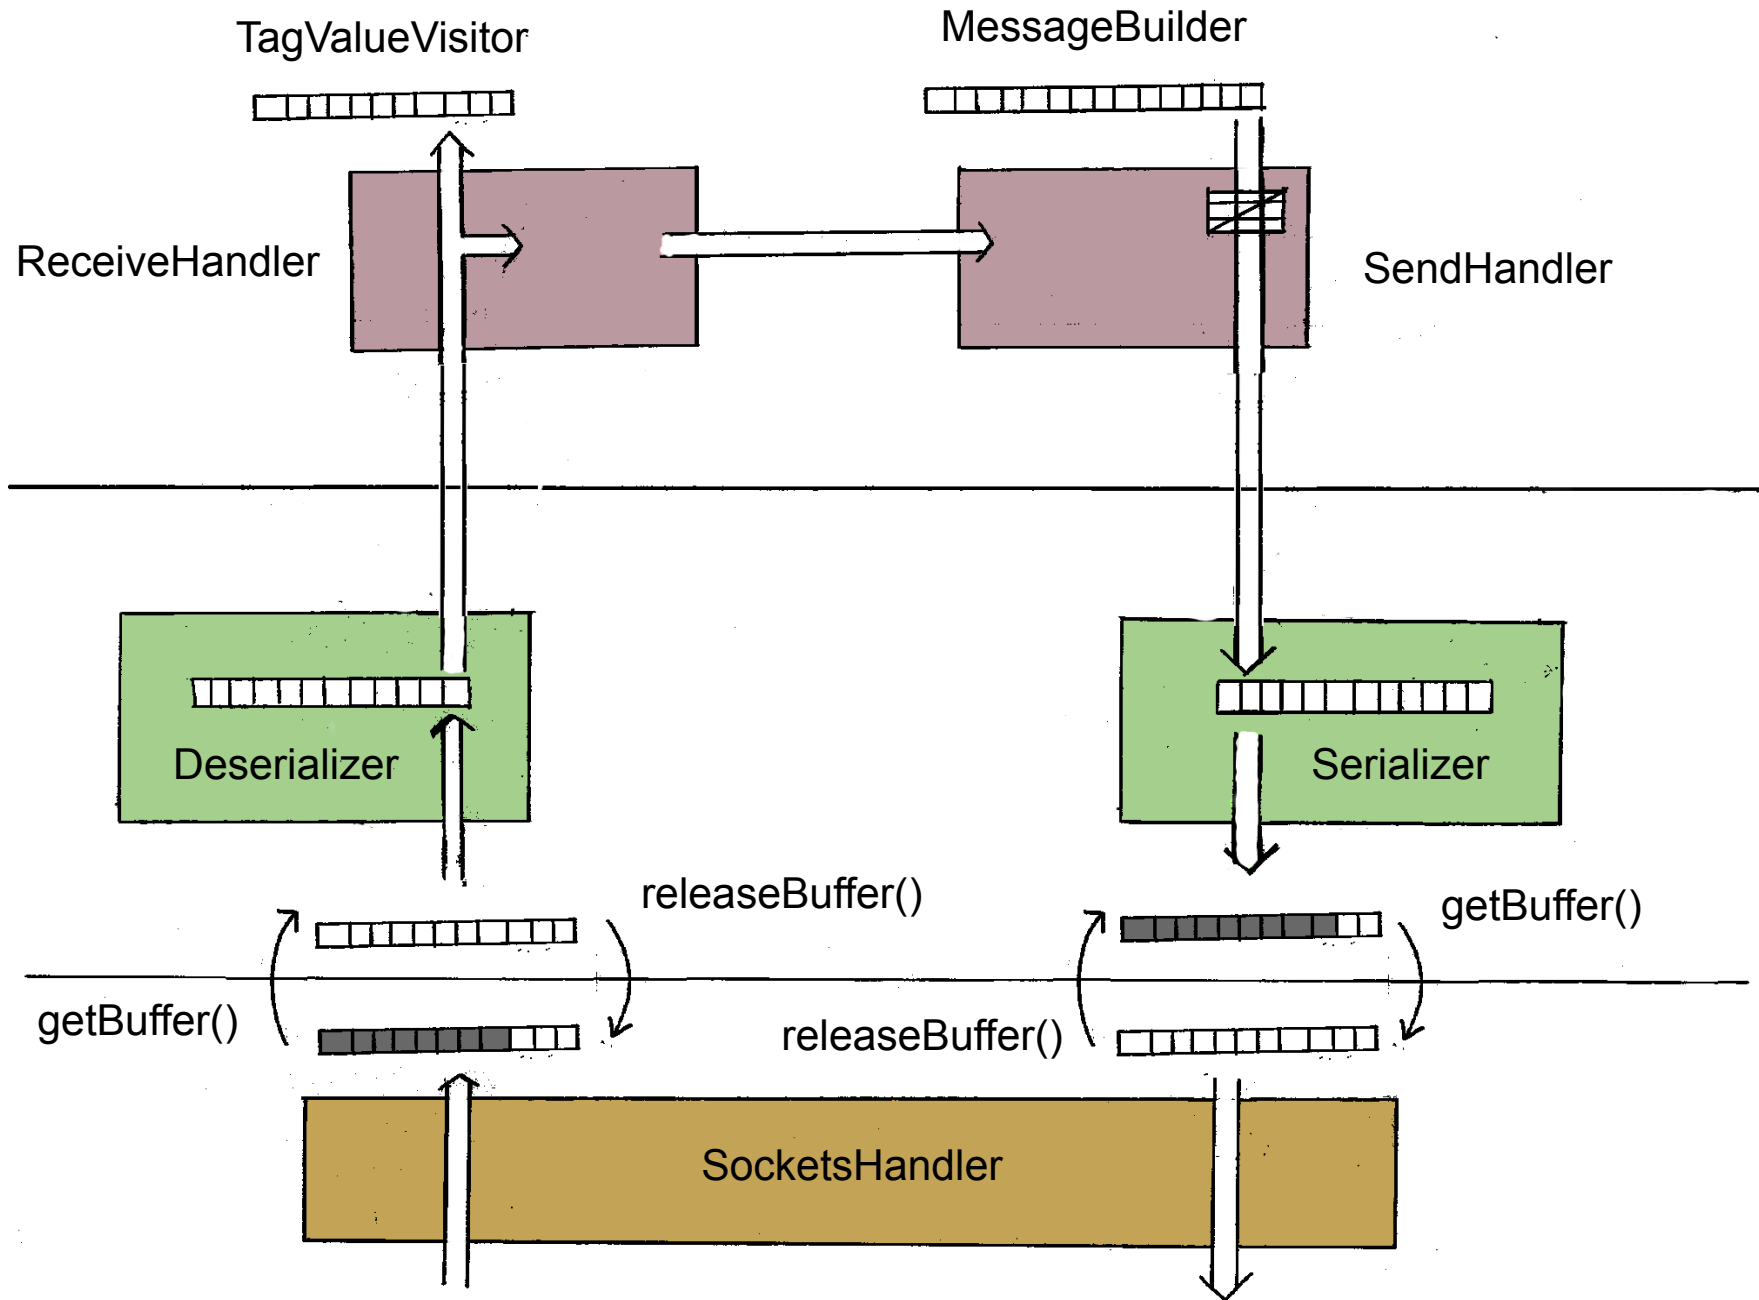

# Intel Testing, 10G SolarFlare and Dell Everest

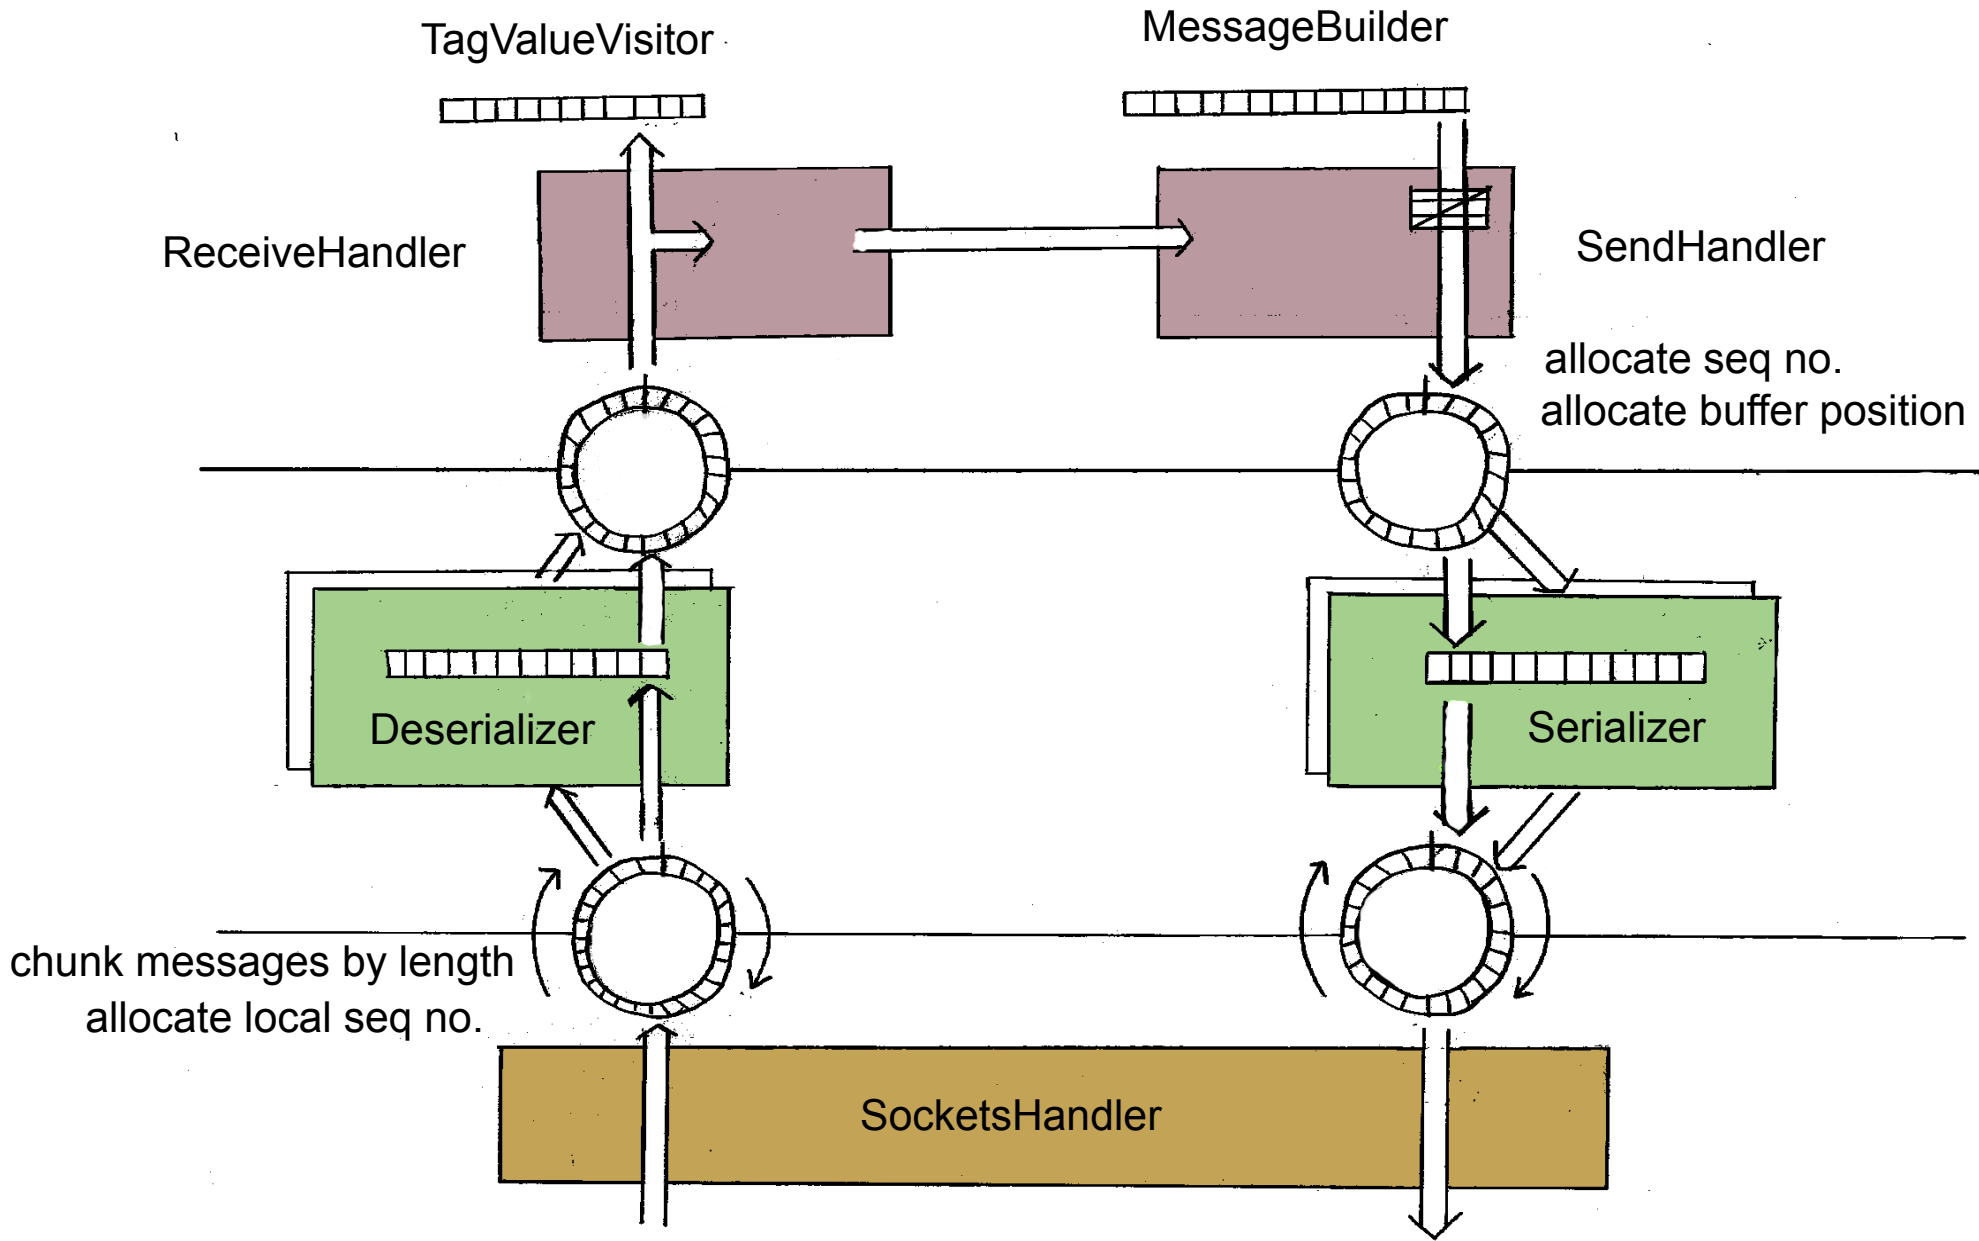

Execution Report to SELL, 10k Market Data msgs/sec

# FIX Engine Overview

# FIX Engine - With Internal Queues

# FIX Engine - With Hardware Implementation
